At least 90% of the repeaters manufactured today have this capability.

Art,

Been there done that, unfortunately that database has nothing prior to 1981, the micor was produced before then and has an old FCC ID which cannot be looked up on line.

Keving,

Thanks for your info and taking this chase on, I really appreciate
it as well as all the other MastrII and Micor GMRS repeater owners.

Keep us posted and Happy New Year.

Speaking of Christmas bubble packs. I have a few kids on our repeater output. Finally some idiots who give their kids radios with GMRS freqs!!!!!

Now all I have to do is track them down. I believe it will be easy since they're in my neighborhood.

Any ideas on where I can get a good but cheap directional antenna?

From: ray@rayvaughan.com
Topic: 9396 Message: 9418

I don't think it's possible to make definative decisions on Part 95 approvals by just the name of the radio. If I remember correctly, any radio with a designed output of more that 50 watts automatically wasn't approved for GMRS. So while a 110 watt Mastr II wouldn't be type accepted for Part 95, a 35 watt Mastr II could have been. So you really do need the full combination code for the specific radio.

Also keep in mind that the modifications we take for granted in Amateur Radio violate type acceptance under Part 95. Adding an ID-er or a power supply, no problem. But if you're working on the RF sections or adding a PA you could run into trouble.

All of the GMRS frequencies are on the output frequencies of the repeater pairs, so what is your point? Repeater input 467.550, output 462.550; talk around input 462.550, output 462.550. This is the case for the other seven GMRS frequencies.

9422. Bahamas use of GMRS / FRS

Yahoo group: GMRS (2005 — 2007)
Date: 2005-01-05 00:26:36 UTC
From: studmuffin_hp
Topic: 9422 Message: 9422

I posted a few inquiries and never received a definative answer. Anyhow, just returned from a week in Nassau. Stayed at Atlantis. Found heavy usage on most of 22 channels by tourists. Never heard hotel staff or security on any of the FRS / GMRS frequencies. There was one group of about 10 families who came supplied with radios. I never got an answer as to whether usage was prohibited there, but quite openly in use. We brought a radio for each of the four of us and found it quite handy.

Ray,

you are incorrect about the power capability of the radio voiding the cert for part 95.

If you look back at the link I posted for the mastrII it was a 100 watt radio. Remember the PA is adjustable.

If you do a search for all part 95 radios on the FCC site you will see many 100 watt capable radios. It will also note the power out is adjustable. You will not find one that is fixed (non adjustable) output.

And that WAS his point. Seven GMRS freqs are the repeater *outputs*.
These *same* frequencies can be used as *simplex* communications
frequencies also. As such, hearing simplex comms on one's repeater
output is neither surprising, nor in violation of any regulations,
unless said persons using the frequencies are unlicensed.

Topic: 9390 Message: 9428

I think he's just clarifying what the output is. Might have thought I said that they were using the input freqs from my original message.

I have (other) kids on my repeater output talking, which jams up my receiving and hearing capabilities. Plus the fact that they are kids to begin with. Ringers, "code names", etc. Need I say more. Now I feel the pain and fustration that the rest of you do...

I'll be talking with their parents soon, to inform them of the license they need, or the fines that they can pay. Merry Christmas... =c) lol

I did read the first post but my question still stands. So what is someone trying to say? Your in a GMRS forum, so I'm assuming your talking about the GMRS frequencies. Does someone think that someone can't talk on the output GMRS repeater frequencies? If that is the case, someone is incorrect. I do it every day, everyone that talks on a GMRS radio does it all the time.

Dude, read the post again. I cut and pasted it for you right here:
==========
Speaking of Christmas bubble packs. I have a few kids on our repeater
output.
Finally some idiots who give their kids radios with GMRS freqs!!!!!
Now all I have to do is track them down. I believe it will be easy
since they're
in my neighborhood.
==========

The original thread pertained to GMRS unlicensed bubble pack radios
which came out on Christmas. Its clear he replied to this thread
specifically, its clear he's talking about GMRS frequencies, its
clear the writer has a repeater they monitor, thus the reason he
heard it in the first place. He never said it was illegal to use
simplex for a licensee, nor did hey say he hordes the frequency. The
original thread was about unlicensed bubble pack radios.

Chris

See that's what I don't like about this group. Someone has to take the original text out of proportion and then try to tell it their way.

I was saying that kids (who are unlicensed, as in 6 year olds) were on my repeater output, talking and jamming the OUTPUT frequency all day. Was just making a comment on the pain everyone feels that I now feel as well.

This doesn't have to be a war on who get's it right first and who knows it all. Sometimes I wonder why I stayed on here to begin with. It was very informative. Then you get airheads who think this or that. Not saying that Gary or Jeff is, but others out there.

It was just a small nice comment!!! Yeesh!

You might want to give out some "politically correct" information on your repeater when this happens as to the illegal use if bubble packs on ANY frequency that the user is not licensed for. You might just get lucky and have one of the youngsters parents listening. But no guarantees.

Obviously you can talk over the top of them. Since they are unlicensed and are therefor operating illegally {and not calling for help in an emergency), they theoretically don't exist. They may eventually get the idea and move to another frequency or give up on their "toy" radios.

This question has probably been asked before; however, I am unable to find information.

Is there a list that identifies GMRS Type Accepted radios?

If not what is the proper procedure to identify specific radios type acceptance?

Knowing is a radio is type accepted for GMRS usage is a good thing prior to using it.

Thanks,
Jeff

Jeff,

All equipment built in the last 15 years are listed on the FCC web site. Equipment that has the old FCC ID numbers are not listed in the on-line data base. You will need to contact the manufacture for a copy of the type acceptance certificate.

But if you go to the FCC site and do generic equipment search and key on part 95 you will get a list of all part 95 radios.

I will post the link in a bit if someone else does not.

Jeff,

See this page on my site http://digio1.com/cgrg/part95.html
It is a list in progress of popular commercial radios that
are/aren't certificated for use in part 95, but is nowhere near a
complete list.

But there is not an official list anywhere that I know of. But here
is the way to find out if a radio is certificated (new fcc jargon,
they dont use type accepted anymore)you need to do an Equipment
Authorizion search here at the FCC site:
https://gullfoss2.fcc.gov/prod/oet/cf/eas/reports/GenericSearch.cfm

You will need the FCC ID of the radio, here for example is the FCC
ID of a Motorola M1225 UHF Radio: ABZ99FT4044- The first three
letters/numbers are the manufacturer Id and the rest is the product
code that is all you need then hit the search button, when the file
list comes up click on the display grant blue checkmark. This will
display the grant and what the unit is certificated for Part 90, 95
etc.

Jeff,

Here is a response from the folks at M/A com.

For older gear if you could find a copy of the "orange" book he talks about, it will have all the listings.

to look it up on-line with current FCC xmiter ID's try this link.

<https://gullfoss2.fcc.gov/prod/oet/cf/eas/reports/GenericSearch.cfm>

"Kevin,

Was someone cited or fined for using a GE MASTR-II repeater for GMRS because they were not type accepted? If so, we may be able to find a copy of the grant, if someone needs to fight the citation.

I think it is a case of the FCC can't look back beyond the electronic database to the paper files. I remember many years ago there was an orange book printed by the Govt Printing Office that listed all the equipment and the specs of the grant. I trashed my well worn copy 5 years ago after too many moves and seeing the FCC website. Guess I should have kept it :)

Jeff,

The radio should say type accept on the radio itself. It should be on the back or underneath the battery. Or on the bottom of radio. All major companies are type accepted RS, Motorola, Kenwood etc....

Kevin,

Any luck on the Micor repeaters?

All commercial radios are type accepted for some service but you have to look up the specs to find out what services they are type accepted for. (Part 80, 87, 90, 95, etc.)

Bill - Yes, the Kenwood TK-3140 is type accepted for Part 95. It also covers type acceptance for Parts 22, 74, 90 and 95 which is included for the Type 1 version TK-3140K-1 (450-490 MHz). All other versions (TK-3140K2 470-512 MHz & TK-3140K3 400-430 MHz) omit the Part 95 acceptance since it doesn't cover the GMRS frequency range.

Kenwood also makes other fine models that have type acceptance for Part 95. All have great value and are packed full of features. I personally use the TK-370G with alpha-numeric display and full feature keypad making it an ideal radio for business, GMRS and amateur use.

Portables
TK-360G
TK-370G (Best value price vs. features)
TK-380 (Conventional & LTR trunking)
TK-390

Mobiles
TK-860G (25 watt)
TK-860GH (45 watt)
TK-880 (25 watt)
TK-880H (45 watt)

There may be more models. The models mentioned above just happen to be the more popular models in use.

I went there and typed in a few FCC Id numbers and did not come up with any results on there. Is more info needed than just the FCC ID number?

Mathew

All commercial radios are type accepted for some service but you have to look
up the specs to find out what services they are type accepted for. (Part 80,

87, 90, 95, etc.)

While you list some good ones above, you left out some good radios for first time users. If you want just a basic programmable radio, the TK-360 (non G) model gives you 4 channels with no bells and whistles. A step up is the TK-350, 32 channels with self programming mode or 160 channels programmable via computer only. The TK-350 has scanning, talk around, plus a lot of other features. Both of these are hand helds. For a mobile, try the TK-805D (25 watts) or TK-805DH (35 watts). Both can be programmed from the front panel without need for software, does scanning, talk around, CTCSS/DCS. For a basic mobile it is hard to beat. Their is also a plain TK-805 that does not scan or have talk around and only does CTCSS tones. I have one of each and would be hard pressed to find a better mobile for basic needs, such as mine are. Any of these should be found on Ebay for less than $150.00, with the TK-360 less than $90.00. Please keep in mind that Kenwood makes 3-4 different types within each listed model, only one of which is suitable for GMRS use.

My favorite radio is my TK-390. Top of the line Kenwood hand held. Many more features than I need but outstanding in every aspect. I found a pair for $200.00 each and one was even brand new, never been used!

Yes, Bill, it is certified for Part 95.

Go to YOUR yahoogroups file section and upload the file I posted listing all the certified radios per the FCC website for Part 95.

Ed

Hi, just recieved my GMRS radio station authorization. I would like to set-up a repeater in my home town. Is there any listings or guidelines that will point me in the right FCC direction to license it? I have a FRN # & call sign. Ray B. WQBY502

9453. Flagler County Assist REPORT for 2004

Yahoo group: GMRS (2005 — 2007)
Date: 2005-01-20 18:09:28 UTC
From: Bob Pickering
Topic: 9453 Message: 9453

GMRS was used for most of these activities. This report shows how GMRS can be used for public service.

Flagler County Assist REACT Activity Report 2004.
Activities and Operations performed by Team

ABOUT THIS REPORT
We pride ourselves in our unique organization and what we do. This report details activity of the REACT Team in the past year and is to inform the community of the work conducted by our dedicated volunteers.

ABOUT FLAGLER COUNTY ASSIST REACT
High school students who wanted to make a difference established Flagler County Assist in 1985 with the purpose of using CB radio to help others. Today we are a 501.3(c) non profit organization. Our mission is to provide assistance to Flagler County, non profit organizations and municipalities with volunteer services. We provide communications and logistic support during emergencies as well as public service events. REACT stands for Radio Emergency Associated Communications Team. Our volunteers receive training from the National Weather Service and Flagler County Emergency Services as well as from other agencies when available.

CONTACTING REACT FOR HELP
For planned events, FCA REACT requests that you contact us at least 2 weeks in advance, earlier if possible. That will allow our volunteers to set time for the event. REACT help for planned events can be contacted requested via 445-7644, 437-9157 or 445-4668

For Emergencies such as searches and any other time critical requests, REACT can be contacted through the numbers above or the Emergency Services Duty Officer or Sheriff's Dispatch. REACT always self activates for severe weather in response to conditions or requests from the National Weather Service. We will respond 24-7 to any emergency request depending on availability of appropriate Team members.

2004 TEAM ACTIVITY
The following is a listing of all events and operations in which Flagler County Assist REACT participated.

PUBLIC SERVICE EVENTS
The following are events worked by the Team that assist a charitable organization or provide assistance to the public. We use these events as training grounds for emergencies as well as in an opportunity to test our equipment and readiness.

Date Event Assisting
4/3/04 Walk for the Animals Humane Society
7/04/04 Fourth of July Parade Flagler Beach PD and FC Chamber
12/11/04 Christmas Parade Flagler Beach Flagler Beach PD / Rotary Club

TRAINING EVENTS
The following are training sessions held to help prepare the Team. We pride ourselves in our training and many members have taken a number of training classes from a variety of sources.
Date Event Purpose
(49 Nets) Weekly Radio Drill Weekly Training Session
(12 Meetings) 1st Sunday of month Monthly Meeting and Training Session
2/25/04 Search and Rescue Training Training new members
2/27/04 Tornado Drill Assist FCES & NWS
3/10/04 Skywarn Class Required NWS training.
7/20/04 PSN Drill Assist Flagler County Emergency Services

SKYWARN OPERATIONS
The following are operations that support storm spotters. Storm Spotters report severe conditions so warnings may be issued faster. These operations support the National Weather Service and Emergency Services in Flagler County. All of our members are certified storm spotters trained by the National Weather Service and many are Advanced Spotters.
Date Event Assisting
5/01/04 Skywarn Net Activation National Weather Service (NWS)
5/02/04 Skywarn Net Activation National Weather Service
6/02/04 Skywarn Net Activation National Weather Service
6/03/04 Skywarn Net Activation National Weather Service
6/04/04 Skywarn Net Activation National Weather Service
6/26/04 Skywarn Net Activation National Weather Service
7/03/04 Skywarn Net Activation National Weather Service
7/14/04 Skywarn Net Activation National Weather Service
8/12/04 Skywarn Net Activation National Weather Service (Hurricane Charley)
8/18/04 Skywarn Net Activation National Weather Service
9/04/04 Skywarn Net Activation National Weather Service (Hurricane Frances)
9/05/04 Skywarn Net Activation National Weather Service (Hurricane Frances)
9/26/04 Skywarn Net Activation National Weather Service (Hurricane Jeanne)

SEARCH AND RESCUE OPERATIONS
Flagler County Assist REACT provides communications for the Flagler County SAR Team and is also called upon to assist with searches for lost people etc. A number of members are SAR TECH II certified and many have taken the basic SAR training offered by Emergency Services.
Date Event Assisting
3/05/04 Activated for search, called off FCSO

EMERGENCY OPERATIONS CENTER AND OTHER SUPPORT
Non-Emergency Support - REACT volunteers assist in day to day operations as well as special projects. Many volunteers are trained to assist in the Emergency Operations Center.
Date Event Assisting
1/31/04 Home Show / Assist FCES Flagler County Emergency Services
2/6/04 Station 41 Grand Opening Flagler County Emergency Services
2/20/04 Step Up Florida walk a thon Flagler County Emergency Services
6/5/04 Fire Flight Landing Zone (LZ) special event Flagler County Emergency Services
10/27/04 Fire Flight LZ special event Flagler County Emergency Services

EMERGENCY SUPPORT
The following are events when the Team provided personnel for the EOC during emergencies, or when members were called upon during an emergency or assistance call.
Date Event Notes
4/1/04 Wildfire Team responded to EOC.
8/12/04 Hurricane Charley Team supported in EOC
9/4-15/04 Hurricane Frances support during and post storm EOC support and assist the City of Palm Coast.
9/24-26/04 Hurricane Jeanne support Pre, during and post storm EOC support

TOTAL EVENTS AND TRAINING = 120 (2003 was 86)
2004 Membership - 25 (2003 was 24)
Total Volunteer Hours - 1,600 hours (2003 was 746.39hours)

NEW VOLUNTEERS ALWAYS NEEDED!
We are always looking for more volunteers to help us help others. As stated before REACT is a volunteer organization. Our members pay dues and also purchase their own radio equipment. Usually a new member can get on the air for under $250.00. NO TESTING REQUIRED FOR LICENSE!

For more information visit our website at www.react4800.org. Our meetings are the First Sunday of each month at the Emergency Operations Center in Bunnell at 7:00 P.M. Our meetings are OPEN to the public. However contact us first to make sure the meeting is going as scheduled before coming down. Events and holidays may postpone regular meetings of our organization.

Approved by the Officers of FCA REACT #4800
"Serving the area since 1985"

VOLUNTEER WITH US!!!!
Flagler County Assist REACT http://www.react4800.org

9454. Part 95 and Type Acceptance

Yahoo group: GMRS (2005 — 2007)

From: w9mwq
Topic: 9454 Message: 9454

I just read the entire part 95 regarding the rules and regulations for GMRS, but no where did I see anything that says a radio has to be 2 PPM, however I do have a document from the FCC regarding a 5 PPM Uniden Repeater that says it is accepted, with reduced power of 20 to 25% of it's normal power of 25 watts. If the FCC approved it, would they unapprove it? Also, it says you cannot use the system for dispatch for hire, but can it be used to conduct business, say a farmer telling someone to go pick up a part, or say a small business talking between stores or to a delvery person, say go here go there.

What is the extent of the communications that can be conducted on this system.

Mathew

Bill,

It is a MS-Excel file and may be "read only" if that window pops up although I didn't save it that way that I am aware of. If you don't have MS-Excel, you may download a free Excel Reader from the Microsoft website. Many spreadsheet programs also will translate it for you into your own preferred program.

9458. How big a battery for the ICOM IC-G21GM?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-01-21 04:48:28 UTC
From: mryan301
Topic: 9458 Message: 9458

Hello All,

I know the IC-F21GM comes with a BP222 or 600 ma battery. This seems a little small as even the ICOM site says it lasts only 4.5 hours typical.

So I'd like to ask an opinion of the group. For all-day use and your personal experiences with the ICOM, do you favor the 1100 ma BP209 or the 1700 ma BP210. The only thing making me hesitate on the BP210 is its very high cost :(

Regards,

Mike

9459. Call Sign Use

Yahoo group: GMRS (2005 — 2007)
Date: 2005-01-21 21:26:22 UTC
From: mhh10714
Topic: 9459 Message: 9459

I just received my FCC license and was wondering about a basic guide that discusses GMRS communication protocol. I'm looking for something that describes the use of call signs. Do we have to use the call sign assigned by the FCC or can we just make up our own call signs or do we even need to use a call sign at all? Also, the FCC assigned one call sign for the family so how do two people use one call sign? I've searched the web and found nothing that addresses this. Hopefully someone can let let me know the official line on this.

Thanks!

9460. Re: Type Acceptance

Yahoo group: GMRS (2005 — 2007)

From: ray@rayvaughan.com
Topic: 9434 Message: 9460

Saying a radio is 'type accepted' is about as effective as saying that it's a radio. Even a reciever may be type accepted under Part 15. It's PART 95 type acceptance we're looking for. We don't decide that.

Say a vendor made an awesome handheld that had much better specs than GMRS calls for. Could we use it? Only if the vendor took the extra step to get the radio type accepted for Part 95. If they didn't think it was worth the paperwork and never filed for it, then no, it's not legal for use in GMRS. Specs like 5 PPM instead of 2 PPM or 110 watts instead of 50 are reasons that a radio may NOT be type accepted, but meeting those specs with the right numbers doesn't make a Part 90 radio type accepted in Part 95.

First of all thank you for getting your licence!

I take it you haven't read the FCC rules regarding use of GMRS frequencies. Of course you have to use your call sign. You must state it at the end of every conversation or if lengthy, every 15 minutes. Yes one license covers all family members except for cousins. How each member is assigned a designator is up to your family. Around here in our group each user has a Unit number. My spouse is say Unit 27 and I am Unit 29. Others use Unit 34 for the husband and Unit 34 alpha for the wife. But no matter what you use, when your done talking you must sign off with your FCC call sign. Some say that only one member of the family needs to sign off, and not all family members using the radios in the same conversation. Others will tell you that all parties have to sign off. I can show you in the rules where it says only one family member and others will read if differently. You'll have to decide what is right and what is wrong for your family.

You MUST use the FCC callsign.. Two people can easily use one
callsign. You may assign "unit numbers" to each family member then ID
"WWWW122 unit 1" ".... unit 2" etc.

Per GMRS regulations:

95.119 Station identification.

(a) Except as provided in paragraph (e), every GMRS station must
transmit a
station identification:

(1) Following the transmission of communications or a series of
communications; and

(2) Every 15 minutes during a long transmission.

(b) The station identification is the call sign assigned to the GMRS
station
or system.

(c) A unit number may be included after the call sign in the
identification.

(d) The station identification must be transmitted in:

(1) Voice in the English language; or

(2) International Morse code telegraphy.

(e) A station need not identify its transmissions if it automatically
retransmits communications from another station which are properly
identified.

The FCC rules clearly state about using your call sign. Yes, you must
ID with a call sign when your transmissions are complete or after
each 15 mins of conversation. Anything after that, such as unit
numbers or designations are at the whim of either you and how you
want to run your system, or at the request of any repeater owner
whose system you may be using.

From: kvsp1160@aol.com
Topic: 9459 Message: 9464

In most cases, many of us use the callsign like amateur radio people do. Say it before, during (every 15 min...), and after your full and complete conversation.

No you may not make up your own callsign. There has been arguements in the past about whether or not a person may use a false callsign instead of their given callsign. Thought it would be more fun and easier. Many REACT and other groups have "names" that they call themselves for their club. For example: "Radio 27 calling radio 32, do you copy?" It's a way of knowing who's who in the group, but is not recommended. So, yes, you do need to use your callsign at all times. Otherwise, what's the purpose for the FCC to give you one in the first place?

For two people (in your immediate family) to use the same callsign, you could say it this way: "This is WPUI299. Dad do you copy (or are you there)?" And when you finnish talking, the last person to leave the air needs to clear out your license: "WPUI299, clear." It's a way of learning responsibility for others who may want to use the frequency after you or to let them know that you're leaving the frequency. This also needs to be used if and when you are on a repeater system (which can be covered in a later subject).

Hope this helps. Any other questions that you may have, feel free to ask the group. That's what we're here for! =c)

From: kc7gf@aol.com
Topic: 9459 Message: 9466

You MUST use your FCC assigned call sign at least once every 15 minutes during your conversation. This is so someone can look you up in the FCC database if you need to be contacted for some reason. (improper operation, interference, won the lottery, et)

You MAY use other numbers after your call sign such as WPOL469 1 this is WPOL469 2. I have heard others use such designators as Unit 1 this is Unit 2 or Base this is Mobile 1 or others use such things as Central Base to Metro 1. I've also heard Mom to Dad. A strict interpretation of the rules would say that only a number can be used after the call but everyone seems to use other designators as long as they mention their FCC assigned call at the end of their conversation and every 15 minutes in between.

FCC rule Part 95.119 states,

"Except as provided in paragraph (e) of this section, every station in a GMRS system and every mobile station unit must transmit a station identification:
(1) Following the transmission of communications or a series of communications: and
(2) Every 15 minutes during a long transmission
(b) The station identification is the call sign assigned to:
(1) The GMRS system; or
(2) The station in the GMRS system transmitting communications.
(c) A unit number may be used after the call sign in the identification.
(d) The station identification must be clearly transmitted in:
(1) Voice in the English language with each digit and letter separately and distinctly transmitted (letters may be said using the phonetic alphabet); or
(2) international Morse code...(from 10 to 25 words per minute)
Should automatic Morse code identification interrupt the communications of other co-channel licensee, the Commission may require the use of equipment that will inhibit automatic station identification when co-channel communication are in progress.
(e) A station need not identify its transmission if it automatically retransmits communications from another station which are properly identified. (repeaters).

as long as you ID every 15 mins during your conversation. and at the end of your conversation should be ok... you have met FCC requirements.

I can say " hey John are you there this is Jeff"
and start a conversation.. (nothing says to ID at the beginning.) then if we talk for a 1/2 hr then I would need to ID after 15 mins while talking... then when we are done we would sign off. with our callsigns....

if you are talking to a family member, then maybe you can use your call like this... " WPTT-519 Base clear"
and WPTT519 Mobile clear...

as examples... just as long as you ID every 15 min. and at the end of conversation.

I use BP209's, run at 4 watts, and recharge every other day....or three.
Drain them dead every 4~5 months or so, and they work great.

For family use of your call sign... that depends on
how many people in your immediate family. Yes
everyone uses the same call sign. Say it's a family
of 5, cut up your paper license in 5 pieces, it has
watermarks with the callsign impregnated on it,
distribute the pieces among those using the callsign.
Make sure the person named on the license has the
biggest piece.

If you get one radio then only one person can use it at a time and then you would only need the one call sign. If you make up a call sign please don't make up one that is in use, as the person using would not be able to use there radio when you are using there call sign. If it is day time you can use a night time call sign with out any problems. As they say the lights are on but no one is home. really the best is check the rules on the FCC site for part 95 and enjoy.

From: kc7gf@aol.com
Topic: 9434 Message: 9471

It costs between $25,000 to $40,000 get a radio type accepted by an independent lab who then files all the paperwork with the FCC. (more if the radio fails the tests and has to be retested again) This is why most manufacturers will only get a radio type accepted for the service they think will sell them the most radios. Part 95 is not a big seller. Only the big companies can afford this type of expense. I used to work for a small foreign company that cried every time they had to get a radio type accepted in the US.

Mike,

I found some KENDOO KBP-210CH NiMH batteries on the Internet for about $22
or $24... don't remember which. These are 1600 mAH and work well with my
ICOM F21GM.
KENDOO uses Sanyo cells. The KENDOO batteries last for many hours... I
have never measured the time.

If you'd prefer to pay more for an ICOM-brand battery -- remember, ICOM
does not make batteries. They buy them from someone like Sanyo and mark
them up 2X or 3X.

Good luck!

9473. Re: Call Sign Use

Yahoo group: GMRS (2005 — 2007)
Date: 2005-01-24 16:27:02 UTC
From: Bob
Topic: 9459 Message: 9473

To be completely legal you must use your FCC callsign. There is nothing to stop you from using your own "callsign" (i.e., "Alpha One," "Engine Room," "Charlie Foxtrot," etc.--PROVIDED you ID with your FCC callsign as appropriate.

As for how the members of one family use a single callsign, it usually is something like this:

"WXXX001 Base to Unit 2"
"Unit 2, go ahead"
"WXX001 Mobile 3 to Mobile 4"...
"WXX001 Ed calling Bill"...

I'm sure you get the picture.

You need not use your FCC callsign for every transmission; once you have established communications you can have a long conversation and ID only every 15 minutes, and at the end of your exchange:

"WXX001 Mobile 3 clear."

Now, without a doubt there are GMRS users who never once use their callsigns, just as there a lots of folks who drive 80 in a 60 mph zone. From my experience, identifying properly just makes good sense, and makes communications smoother.

>>...KENDOO batteries...KENDOO uses Sanyo cells...

Sometimes they do. A lot of the time, they do not.

From their Web site: "KENDOO uses quality cells from leading cell suppliers such as SANYO Energy Corporation..." - that's NOT a blanket statement of a firm using quality Sanyo cells 100% of the time.

When I last reviewed Kendoo commercial packs about three years ago, I decided that I would never use nor recommend them to anyone. Poor case construction, inferior cells, and shoddy workmanship were the norm.

If Kendoo has changed their corporate attitude 180 degrees in the past three years, then maybe I should re-evaluate them...

But I doubt that they have.

No one can intelligently answer your question, because we have no idea HOW *you* are going to be using the radios.

One point to consider is that if you go to NiMH packs, then you should also purchase a charger that properly charges them. The standard wall wart AC charger is not the optimum charging method for NiMH packs.

So... specify Sanyo when you order and return them if they are not Sanyo.

All of my Kendoo batteries for my F21GM are Sanyo cells and say so.

ICOM brand batteries don't seem to be any better than Kendoo. I wonder who
ICOM buys their batteries from?

From: kvsp1160@aol.com
Topic: 9478 Message: 9478

Hi Guys,

Just got off the phone with Pryme. Some of you may already know that Pryme had discontinued their line of GMRS-programmed radios, along with the amateur bands that are on there as well. As it turns out, the reason that they stopped, is because their radios are made in China (ya ya I know). Last year, the city that their factory was in, had a major earthquake. The result of this lost all of their components and parts to make the PR-220, PR-460, and other radios. Since they can't support customers with parts or any other customer support for these radios, Pryme stopped making the radios. Plus with the competition from Motorola, Icom, Kenwood, and other leading American communication companies, they felt like it was to much to continue.

However, if you do have any questions about your existing Pryme radio and/or accessories, the staff down there (Los Angeles, CA) are very helpful, and can answer any questions that you may have. They aren't stuck up, like most complain about, but are very nice and understanding. Also, if you lost a manual or your radio didn't come with one, they will be happy and willing to send you another. You can email me for their number, so they don't get swamped with the 1000+ members that we have...

So, hopefully that answers most questions about why they stopped, because I know many of you were wondering. If not, don't come crying to me... =c)

I'm not really looking for a scientific answer, as I can do the calculations or read the specs on my own. I'm looking for real world feedback and opinions regarding what current users of the IC-F21 use and how its worked out for them. Does the BP209 seem to do well for you or do you frequently find yourself with a discharged battery when you need it most?

A shame. I had one (sold it later) and was happy overall. I admit the programming unit was a pain, but I liked how I could easily change CTSS codes easily from the panel and rather liked the ANI/decoder you got with the TTP option. It was a good performer for the money. Only the ICOM IC-F21GM really compares to it for price/performance/flexibility. I know there are lots of outstanding commercial units out there (I have several different Vertex models), but only the Pryme and ICOM gave me reasonable quality, power, durability PLUS the ability to make some changes in the field.

I recall they were talking about later models, but they never came to market. Guess now they never will.

I don't have an F21, but I do have a F4GT, and my radio needs to be
on/working for an average of 10 hours per day, 7 days a week, the BP209
didn't cut it! I had to go to the BP210. I have been much happier ever
since.

I'm surprised no one has brought up the "if my repeater CW ID's the call sign, then I don't need to do it verbally" argument. This is of course how business licensees operate whether with different license types or grandfathered GMRS licenses (or expired ones!)

I also read somewhere someone rigged their radio to spit out the call sign in morse code so they would not have to say it verbally (which I guess was frowned upon, but met the ID requirement)

Many amateur radios have that ability. Listen to 3.840 MHz in the nighttime hours on the west coast to hear a lot of that. Those guys talk for hours and almost never give their call signs verbally. Only via CW.

I ran across an ad for the Midland GXT-400 in Sportsman's Guide and it claims the radio has "4 watts power". It also uses 4 AA batts.

I find it hard to believe the radio transmitts four watts and runs off of 4 AA's.

Any one ever put one of these on a meter?

Rob

Four AA batteries pack a lot of power and four watts is easy to achieve...
many Ham HTs are four watts with smaller batteries.

What Midland probably trades off is battery life and (modulation) sound
quality.

If you're using a repeater, there is no significant difference between two
watts and four watts in terms of getting into the repeater. However, your
battery life will be shorter with four watts than with two.

I use either 1.5 or 3 watts to reach our repeater with no discernable
difference. My three watt radio uses a square lithium battery about equal
in volume to one AA.

It is hard to believe. It is also not true. Looking up the data on
these radios at the FCC website shows them to only put out slightly
above 2 watts ERP.

See;

95.631 Emission types.

(a) A GMRS transmitter must transmit only emission types A1D, F1D, G1D, H1D, J1D, R1D, A3E, F3E, G3E, H3E, J3E or R3E. A non-voice emission is limited to selective calling or tone-operated squelch tones to establish or continue voice communications. See 95.181(g) and (h).

Do you have a CW key attached to your GMRS radio?

9490. Re: [GMRS] Call sign Use

Yahoo group: GMRS (2005 — 2007)
Date: 2005-02-01 11:28:41 UTC
From: kvsp1160@aol.com
Topic: 9475 Message: 9490

I don't, but if I did, or if I had a CW unit that re-transmits the CW over the radio for me, would that be okay...

Also, if I had a simplex repeater with a CWID repeating every hour or so (if i did), would that be allowed...

Bare with me. I know the answer (or so i think) but would like addition thoughts and feedback on this before i do... as setting up a repeater is new to me. Not operating on one, which is covered and pretty easy to do... =c)

Thanks,
Ryan

Topic: 9475 Message: 9491

As I see it, you are not required to ID at the beginning of a communication per 95.119 (a). The rules also state that Morse code may be used (d)(2)so yes you may use CWID instead of a verbal ID. If your repeater transmits your ID then you do not have to ID as in (e) but other users would as the transmitted Id is not their callsign.

95.119 Station identification.

(a) Except as provided in paragraph (e), every GMRS station must transmit a
station identification:

(1) Following the transmission of communications or a series of communications; and

(2) Every 15 minutes during a long transmission.

(b) The station identification is the call sign assigned to the GMRS station or system.

(c) A unit number may be included after the call sign in the identification.

(d) The station identification must be transmitted in:

(1) Voice in the English language; or

(2) International Morse code telegraphy.

(e) A station need not identify its transmissions if it automatically retransmits communications from another station which are properly identified.

9492. Re: [GMRS] Re: Call sign Use

Yahoo group: GMRS (2005 — 2007)
Date: 2005-02-01 16:58:19 UTC
From: Bob Gass
Topic: 9475 Message: 9492

Read the rule sections closely. In (a), EVERY GMRS STATION means each individual radio, not just one, or it would specify that only 1 radio could identify the entire system.

And in (e), a repeater retransmits communications, it can't legally identify for the radios using it unless those radios generate the identification each individually.

95.119 Station identification.

(a) Except as provided in paragraph (e), every GMRS station must
transmit a
station identification:

(e) A station need not identify its transmissions if it automatically retransmits
communications from another station which are
properly identified.

In fact, my Icom T7H says its 6W at 13.5V, which the rechargeable
provides, and 5W with 4 AAs.

You will find that new in the box off Ebay is often much cheaper
than wholesale unless you are turning real numbers in quanity.

If you order in 10 case lot or better, you may get a slightly
better deal. Not a lot of markup in GMRS radios.

You might also try Santa Fe Distributing, www.s-f-d.com
tell Harvey I sent ya.

9501. Re: Call sign Use

Yahoo group: GMRS (2005 — 2007)
Date: 2005-02-02 03:13:44 UTC
From: a049806t
Topic: 9475 Message: 9501

Phew! For a second there I thought we were going to drift into a radio modification debate with CW identifiers and Motorola portables.

But here's why I interpret the words differently. The ham repeaters consist of different stations (I see a station as a licensed operator rather than a licensed operator's radio)

Now, the purpose of ID is so you're letting people find you if you're causing intereference. Agreed? So in the case with hams using a amateur repeater, they each need to ID because they are individually responsible for interference issues or whathaveyou.
Having multiple users of a GMRS license, it seems pointless to have everyone ID when it's the same license and if there is an interference issue, the licensee will be conatacted. Not each individual user.
Also, there are limitations for GMRS users that hams don't have such as power limits etc etc. The purpose of the license is not for radio experimentation, not that there's anything wrong with that, and the identification requirement understandably does not need to be as stringent because of that.

Someone already listed this but here's how I understand it. ID during and after a simplex converstation, but only one member of the license has to do it. If other users are not qualified to operate under the license and are licensed individually, they need to ID. A repeater can ID too but other licensees/"stations" have to ID if they are not qualified to operate under the repeater station's license (immediate family or whatever).

GMRS
LICENSING SERVICE

The FCC has
established UHF frequencies aside just for you. If your answer
is yes to
any of these questions, you should consider GMRS:

1.Are you a ham operator without a frequency pair for your repeater ?
2.Are you a business owner in need of commercial grade communications
3.Are you tired of paying for 2-Way radio service ?
4.Are all the 70cm and 2meter frequencies taken up in your town ?
5.Are the amateur frequency coordinators holding your repeater back ?

Well, you don't
need the coordinators anymore and you don't even need to have an
amateur radio

operator's license to legally operate your own repeater on GMRS !!!
WHAT ARE YOU WAITING
FOR ?

Available
frequencies throughout the United Sates are:
462.550,
462.5750, 462.6000, 462.6250, 462.6500, 462.6750, 462.7000 and 462.7250
You can pick
your own channel and operate legally with excellent coverage and voice
quality.
WHAT ARE YOU WAITING
FOR ?

We can assist you in
securing your license from the FCC and you will have all the legal
authority
needed to construct and operate your repeater, just about anywhere in
the United
States.
Have your ham buddies
migrate over to your repeater for a exclusive club of rag chewers.
Even CB
operators can make the jump to GMRS without the hastle of having to learn
complicated electronics or outdated morse code.
Provide your Business
with Commercial Grade Communications and Save on those Monthly Radio
Bills.....
Your Individual FCC
call-sign is typically issued in about 3 weeks
This gives you enough
time to buy the equipment needed to get you on the air or tune
whatever gear you
have now to your new GMRS frequencies !

Are you in South Florida
? We can install your repeater !!
WE CARRY A
FULL LINE OF GMRS PRODUCTS

So What Are
You Waiting For ?
Go

GMRS
TODAY !!!

Not a hoax, for $180.00, a mere $100.00 more than the cost, he will help you get your license. He is not selling the repeater. That ad could get him in serious trouble. Bad news if you ask me, how many people will buy that thinking they are getting a repeater. Ebay should be notified.

He is pretty clear that all you are getting is the license, NOT
the repeater. How could it get him in serious trouble?

Why do you think it's a hoax?? Looks authentic to me, nothing wrong with charging a service fee to someone that doesn't know how to use the FCC ULS. I would question some of the claims..as not letting the buyer know everyone that uses the system needs to be individually licensed. Looks like plain ol'e marketing to me. How many people pay to have their taxes done?

Misleading them into thinking they are getting a repeater. Also, gonna get him lots of bad feedback. That in itself will hurt him.

I don't think the $69.00 handheld radios they are
selling for GMRS are FCC type accepted..that could be
a problem.

Is he not the same guy who is selling Amateur gear to Emergency Service people, telling them they are FCC approved to be used. It's only a matter of time. And his posting, correct me if I am wrong, states business, GMRS is not for business, but for family use?

I read the ad, did you? I even did a "find" using my browser, and nowhere does the word "Business" even appear!

Whats wrong with ragchewing between licensed units, even though the word "ragchewing" does not appear either?

He is only doing for GMRS what hundreds of companies do for LMR frequencies.

I spoke to the seller and he is supposedly changing his ad. There is
nothing wrong with selling a service, but sell it correctly, honestly,
and within the law. This is what we all are here for and hopefully
the problem will be abated!

Chris

All one has to do is READ the ad.

Just because the commercial for a new radio has a
beautiful girl in the ad, does that mean you get the
girl too?

It is VERY CLEAR to anyone that READS the ad, you are NOT
buying a repeater!

i noticed he sells modified (MARS/CAP Option, as he says) ham radios, and if i remember correct, doesn't the radio have to be type accepted to be used on the commercial band...legally?

While I don't agree with the listing I don't find anything in it that even
comes close to suggesting to use it for a business. Please point out where
the word "business" appears!

Quite an accusation. The HAM radios he has listed even include
warnings that it is illegal to operate outside of your license class and
no mention of fire, EMS, or law use.

The radios he does advertise for Fire, EMS, or Law, are from what
I can look up, legal for those bands.

And yes, you are incorrect about the business line.

Ummm... Ya, "business" and "ragchewing" do appear in the ad. Lemme show you:

"...Have your ham buddies migrate over to your repeater for a exclusive club of rag chewers. Even CB operators can..."

"...Provide your Business with Commercial Grade Communications and Save on those Monthly Radio Bills..."

But ya, it could be a hoax, or just some idiot who needs the cash. Either way, i'd report it to eBay. They'll listen. Charging some poor guy $100 to send in two pieces of paper to the FCC... WITH their name and other personal information. Unless you're foreign and don't know what your name, address and phone number is, I think it's a waste of time and money.

I'll go up tomorrow (thursday) and write to the guy and see what he says. If he even has a license of his own... Hmmm... get's me thinking... =c)

Ah come on! We're expected to actually *read* the ads now. Get real. I'm not going to do that. I just look at the pictures. Sometimes I don't even look at those before placing my bid.

It seems a little silly to me to sell that service, but remember not all users who want and plan to use the service legally as it was intended are radio hobbyists (at least I don't think they are) and care to go through the usually finicky ULS. They just want their equipment and want on their air, so let someone else deal with the intracacies of setting it all up. The line about coordination for amateur repeaters bothered me a little bit though. You don't need it to legally operate a ham repeater, not that selling point is invalidated because of it.

I stand corrected, BUT, his offering to sell the service of doing
the licensing is a valid service, just like the hundreds of businesses
that do it for LMR. Nothing wrong with that.

And what is wrong with "ragchewing" between licensed units anyways?

I still find it hard to believe that anyone reading the ad thought they
would get a repeater anyways.

If you find out, I would be very keen to know. I am trying to decide to go or no-go GMRS. I am a Ham, but my wife (of course) wouldn't imagine taking a test nor thinking to care, but DOES want to keep in touch via radio (not cell phone) :-)

I don't have the $ means to put up a repeater myself and am looking also for Scottsdale/Phoenix area repeaters; and would consider helping marginally with the cost if I could find one/more.

Please keep me updated.

Thanks,

Glad someone else read the same ad that I did. He changed it, that is all that matters. As you see, I stopped replying, you defended, but failed to read the ad. Thanks Ryan. At least I was not the only one who "did read the ad". There was no harm done, just misleading to those who may not know any better". He does not need the bad remarks on his bid list, that is all that I was trying to point out.

Mathew

Hello Everyone,

I'm new to the GMRS group...I have a couple questions regarding external antennas: I currently have a couple pairs of handheld GMRS radios (Uniden and Midland, I know...I'm cheap) with fixed antennas, would it be possible to use an external antenna to increase range with these radios? If so, what do I need to look for in an external antenna?

Thanks,
Adam

Adam,

Which models do you have? Several of the Midland radios have removable antennas - they usually have 15 or 23 channels. If they are "22 Channel" models (ones that have all 14 FRS channels), you're out of luck.

Hi Mike,

Only if the radio you are using has frequency 467.xxx, then you may be able to transmit on a repeater. If it has just the 462.xxx freq's, then it's not possible; unless you are operating on a simplex repeater (which can be explained further if need be).

Many and most "bubble-pack" radios do not include repeater frequencies (channels), because thay are made cheap, have very low wattage (doesn't matter what the package says), and are there for local communications only (within 1-2 miles if lucky).

If you want to access a repeater or use your own, I'd suggest to buy a more expensive radio, not a bubble pack.

You are confusing the meaning of the term "split".

The FRS and the shared GMRS/FRS channels are "splinter" channels, meaning they are NARROWer than GMRS only channels.

Repeater capable radios use "split" channels, meaning they transmit and receive on DIFFERENT frequencies, called "half-duplex" in other radio services.

Very few of the "bubble pack" radios are capable of "split" channel operation.

I, myself, use commercial radios that I programmed for repeater and simplex operation on my local frequency.

Hi all--

Looking into something more perminant than the bubble-packs, which have served me very well for skiing up to now...

Is the IC-F21GM radio programmable for repeaters, odd-splits, etc? Does the OPC-478 / CS-F11 (???) programming cable/software even work on this radio?

-Matt-

Adam,

You won't be able to add an external antenna. To get FCC type acceptance to include the 7 FRS-only channels, the radio must have a non-removable antenna. (Your radio has 7 shared FRS/GMRS channels, 7 FRS-only channels and 8 GMRS-only channels).

When shopping for radios, don't worry too much about transmitter power - it doesn't make that much difference in range. If you measure the actual power output of the inexpensive "4 watt" radios, you'll find that it's closer to 2 watts anyway (just like you're unlikely to get "10+ miles" of range from one of these radios). To get a radio that actually puts out 4 watts, you'll have to buy a commercial grade radio which will cost many times what a 2 watt GMRS radio sells for.

Adam,

Which models do you have? Several of the Midland radios have removable antennas - they usually have 15 or 23 channels. If they are "22 Channel" models (ones that have all 14 FRS channels), you're out of luck.

Hello Everyone,

I'm new to the GMRS group...I have a couple questions regarding external antennas: I currently have a couple pairs of handheld GMRS radios (Uniden and Midland, I know...I'm cheap) with fixed antennas, would it be possible to use an external antenna to increase range with these radios? If so, what do I need to look for in an external antenna?

Thanks,
Adam

Thanks Stan!

Do you, or anyone, on the list know of a good online site for □GOOD□ GMRS radios? I□m still trying to decide if I want to go with GMRS or get my Amateur Technician License and stick with HAM bands. I would be using the radio primarily for mountain flying (on a paraglider) and would also like to use it to communicate with □base camp□ when I go canyoneering/rock climbing/backpacking/etc (or possibly get ahold of authorities if I a party member gets injured in a remote area while backpacking/canyoning and needs rescue). Any suggestions?

Thanks,
Adam Lintz

Adam,
I would sugest that you get your Ham ticket. There are far more repeaters and Hams out there. Plus for a price you can also buy your GMRS ticket and have both.

Morning Adam

May I recommend both! My opinion is that the more viable
communications options one has in a given situation, the better.

PS...I know you didn't mention it, but be sure NOT to consider MURS
for your paragliding or anything involving one being
airborn...that's an FCC no-no.

If it's one or the other, definitely get the ham ticket.
As others have said, many more repeaters, autopatch available
(definite no-no on GMRS) and just generally more possible radios
listening to your frequency should you need assistance.

Adam,

Instead of everyone telling you just to get a ham license, because
thats what hams do, what do you need for radio comms? Are you looking
to talk to other hams, or what? I would imagine while you are
communicating with "base camp", who's going to be on the other end?
Most of the excursions you talked about require other people with you
for obvious reasons. Will they be getting ham licenses too? Would
they take the tests? If so, great! If they would not, would they be
willing to shell out the $$$$ for the GMRS license?
What I'm getting at, is what do you plan on doing with your radios?
Is it for while you are out mountain climbing or hiking with friends,
or is it to talk to your wife, or is it to meet new people?
You said:

Remember the target, audience, or parties on the other end of the line
if you are specifically going to get a license for these activities.
Just my two cents worth...

Chris

Hi Chris,

Thanks for the info. The people at base camp would more-likely-than-not be family members which, if I'm not mistaken, the GMRS license covers it. Likewise, if I decide to go ham, I think my wife would take the technician test as well so we'd be covered (she's way into camping and hiking, but not too into real technical stuff that usually involves abrasions and rapelling into cold stagnant water-filled pools when descending slot canyons). From what I've heard around the paragliding community, they mostly use the FRS band (for ridge flying where's there's very little distance and great line-of-site) and a specific HAM frequency that (from what I've been told) does not require a license. Those pilots without an amateur license end up buying a special HAM radio that is "hard-coded" and does not allow frequency change. Thos pilots with amateur licenses end up using programmable radios.

No real interest in radio as a hobby (no offense), more as a tool for communication while engaging in other hobbies (although I've been known to get obsessed with "toys"). So.I'd like the most distance over varied terrain. Licensing issues aren't really a problem, whatever choice I make, the proper licensing will be done.

Any more suggestions? Is it possible to pack a semi-portable repeater during a trip and drop it off at a halfway point, then pick it up on the way out? Or is that idea ludicrous? I'm still very undecided. I have four of what I've heard called 'bubble-pack' GMRS/FRS radios that I've been using for ridge flying. I'd like a better solution since I've noticed how poorly little handhelds perform over anything other than line-of-site or when you have plenty of altitude/elevation in relation to the party you're talking with. Does the same apply to more expensive radios and/or portable HAM radios?

Thanks,

Adam

As for the paraglider... GMRS would NOT be legal in this capacity --
antenna height restrictions. Ham, on the other hand, would be, as
there are no such restrictions. Just make absolutely sure you're on
a simplex freq in the band plan. As you might imagine given that we
all strive to get our antennas up as high as possible, you'll have
huge coverage with even a tiny amount of power...

Mounted antenna height...
If he has a portable, we're in a different area now...
We should look closer onto this.

Chris

Adam:

Portable repeaters are pretty expensive. Don't think you would want to to risk leaving it on a hill and expect it to be there when you got back. Also, it would need batteries that you would need to pack in that would be pretty heavy.

A better solution might to be to investigate installing a dual band Mobil Ham set in your vehicle. If you get the correct one, they can be setup to work as a repeater between your hand held and another repeater. This way you can park on a hill and lock it up. You may need to add an extra battery to your vehicle to insure that it is going to start when you get back.

Bill

9555. Radio Services

Yahoo group: GMRS (2005 — 2007)
Date: 2005-02-16 04:56:04 UTC
From: kvsp1160@aol.com
Topic: 9555 Message: 9555

Hi Guys,

Being lazy out here in CA, and not having the patience to search it out, what's the difference between LMRS, MURS, and GMRS?

Heard that many consider those over GMRS (or vise versa), but haven't really covered what the heck they are.

Thanks,
Ryan
WPUI299
San Jose, CA

9556. Re: [GMRS] Re: Newbie - w/ questions

Yahoo group: GMRS (2005 — 2007)

From: kvsp1160@aol.com
Topic: 9534 Message: 9556

Replying about the batteries:

Batteries are one thing to keep in mind, but being cost effective and simple, you can also hook up a few solar cells to a rechargable battery (block), which would be most effecive. Then encase all of your equipment in a weather-sealed metal insulated case with lock, and strap it to a tree. Shouldn't be too heavy, it you build it with enough thought put into it.

This subject was covered last spring in this group, pertaining to backup batteries in emergencies and power outages. Check out the archives, or ask around.

73's,
Ryan

9557. Re: [GMRS] Re: Newbie - w/ questions

Yahoo group: GMRS (2005 — 2007)
Date: 2005-02-16 05:07:53 UTC
From: kvsp1160@aol.com
Topic: 9534 Message: 9557

Hard-coded or not, I believe that ANY person operating on any chosen single amateur frequency, needs to be licensed. From what I've been studying and reading for the past 5 years now, any frequency that is covered under the amateur radio bands, needs to be licensed.

Where and who said that this (hard-coded ham radio) is allowed with no license?

Even though I am not a ham operator, my understanding is that this type of operation is a definate no. Give me a FCC rule directly from the book to state otherwise.

73's,
Ryan

Sorry if this is a duplicate, I may have replied from my "work" address which is not registered with the group...

Ooops...I just called someone "in the know" regarding paragliding radio frequencies. So here's the correction, the USHGA (United States Hang Gliding Association) is authorized to issue permits to communicate on a handful (I believe he said 5) frequencies that are on a business band (151.XXX MHz). There is certification involved and one must purchase a non-programmable, crystal controlled radio that is tuned the the USHGA frequencies only. Sorry for the confusion (I'm still learning :)), these are not on the 2m amateur band...

Adam:

Portable repeaters are pretty expensive. Don't think you would want to to risk leaving it on a hill and expect it to be there when you got back. Also, it would need batteries that you would need to pack in that would be pretty heavy.

A better solution might to be to investigate installing a dual band Mobil Ham set in your vehicle. If you get the correct one, they can be setup to work as a repeater between your hand held and another repeater. This way you can park on a hill and lock it up. You may need to add an extra battery to your vehicle to insure that it is going to start when you get back.

Subject: RE: [GMRS] Re: Newbie - w/ questions

Hi Chris,

Thanks for the info. The people at base camp would more-likely-than-not be family members which, if I'm not mistaken, the GMRS license covers it. Likewise, if I decide to go ham, I think my wife would take the technician test as well so we'd be covered (she's way into camping and hiking, but not

too into real technical stuff that usually involves abrasions and rapelling into cold stagnant water-filled pools when descending slot canyons). From what I've heard around the paragliding community, they mostly use the FRS band (for ridge flying where's there's very little distance and great line-of-site) and a specific HAM frequency that (from what I've been told) does not require a license. Those pilots without an amateur license end up buying a special HAM radio that is "hard-coded" and does not allow frequency change. Thos pilots with amateur licenses end up using programmable radios.

No real interest in radio as a hobby (no offense), more as a tool for communication while engaging in other hobbies (although I've been known to get obsessed with "toys"). So.I'd like the most distance over varied terrain. Licensing issues aren't really a problem, whatever choice I make, the proper licensing will be done.

Any more suggestions? Is it possible to pack a semi-portable repeater during a trip and drop it off at a halfway point, then pick it up on the way out? Or is that idea ludicrous? I'm still very undecided. I have four of what I've heard called 'bubble-pack' GMRS/FRS radios that I've been using for ridge flying. I'd like a better solution since I've noticed how poorly little handhelds perform over anything other than line-of-site or when you have plenty of altitude/elevation in relation to the party you're talking with. Does the same apply to more expensive radios and/or portable HAM radios?

Thanks,

Adam

Adam,

Instead of everyone telling you just to get a ham license, because thats what hams do, what do you need for radio comms? Are you looking to talk to other hams, or what? I would imagine while you are communicating with "base camp", who's going to be on the other end? Most of the excursions you talked about require other people with you for obvious reasons. Will they be getting ham licenses too? Would they take the tests? If so, great! If they would not, would they be willing to shell out the $$$$ for the GMRS license?
What I'm getting at, is what do you plan on doing with your radios? Is it for while you are out mountain climbing or hiking with friends, or is it to talk to your wife, or is it to meet new people?

Remember the target, audience, or parties on the other end of the line if you are specifically going to get a license for these activities.
Just my two cents worth...

Chris

9559. RE: [GMRS] Re: Newbie - w/ questions

Yahoo group: GMRS (2005 — 2007)
Date: 2005-02-15 17:06:28 UTC
From: Mathew Quaife
Topic: 9534 Message: 9559

Not true, you have to have a ham license to operate on Ham frequencies, there are no exception to the rules other than in life and limb danger, and it had better be the only means of communications.

To further, your GMRS license covers your family, not a whole base camp.

Mathew

I don't think the antenna height would apply in this issue, in the sense that you are talking. It states that it cannot be more then 20' above the structure in which it mounted on, does not give any restrictions to aeronautical, so long as it's not on a commercial plane.

With what you are saying, is if I lived on a mountain that was 5000 feet high, I would not be able to use my GMRS because I was up to high. His antenna would still be below his structure.

As for the paraglider... GMRS would NOT be legal in this capacity -- antenna height restrictions. Ham, on the other hand, would be, as there are no such restrictions. Just make absolutely sure you're on a simplex freq in the band plan. As you might imagine given that we all strive to get our antennas up as high as possible, you'll have huge coverage with even a tiny amount of power...

Hi, Again, Adam. I'm going to work on this one by adding things into the message so I can follow here.

> Hi Chris,

YO!

>
> Thanks for the info. The people at base camp would more-likely-than-not be
> family members which, if I'm not mistaken, the GMRS license covers it.

The GMRS covers the family members. If they are not, they would all need to get a license, which covers them and thier families also. You can intercommunicate amongst families at this point, as long as the licensing is in order.

> Likewise, if I decide to go ham, I think my wife would take the technician
> test as well so we'd be covered (she's way into camping and hiking, but not
> too into real technical stuff that usually involves abrasions and rapelling
> into cold stagnant water-filled pools when descending slot canyons).

Thats great she would take the test. Ham radio and GMRS both have their ups and downs, but if she gets the license, it may open up a new world for you two. Likewise, if you get a GMRS license, then you could establish a repeater, or work on a collective one. Make sure your rigging stays tight and don't shockload that rope!

From
> what I've heard around the paragliding community, they mostly use the FRS
> band (for ridge flying where's there's very little distance and great
> line-of-site) and a specific HAM frequency that (from what I've been told)
> does not require a license. Those pilots without an amateur license end up
> buying a special HAM radio that is "hard-coded" and does not allow frequency
> change.

You explained this later on that youre part of an organizations which has a collective business license for its members. This may be a viable option also, if your group are all members that you could use that. FRS radios work good when they are 5,000 feet in the air, as

does most all radios! hahaha...

Thos pilots with amateur licenses end up using programmable radios.
>
Yes, we hams have lots of programmable radios!

> No real interest in radio as a hobby (no offense), more as a tool for
> communication while engaging in other hobbies (although I've been
known to
> get obsessed with "toys").

Take this into consideration with your ham license questions at this
point. Ham radio is a hobby, but if you're using it for business, then
GMRS, FRS or a business band radio may be more suiting. Think about
this before you being to study the theory for the ham test. Its not
difficult, but does require some self-education.

So.I'd like the most distance over varied
> terrain. Licensing issues aren't really a problem, whatever choice I
make,
> the proper licensing will be done.

You are indeed a smart man. Distances are always a radio issue, so
educating yourself is the way to go.

>
> Any more suggestions? Is it possible to pack a semi-portable
repeater during
> a trip and drop it off at a halfway point, then pick it up on the
way out?
> Or is that idea ludicrous? I'm still very undecided.

Anything is possible. Just remember security of its location, it
could get stolen or tampered with. Not to mention antennas,
duplexers, etc. This is a whole 'nother topic on its own.

I have four of what
> I've heard called 'bubble-pack' GMRS/FRS radios that I've been using for
> ridge flying. I'd like a better solution since I've noticed how poorly
> little handhelds perform over anything other than line-of-site or
when you
> have plenty of altitude/elevation in relation to the party you're
talking
> with. Does the same apply to more expensive radios and/or portable HAM
> radios?

You get what you pay for, but UHF signals are line of sight, thus the
reason repeaters are always a hot topic. 25 dollar toys from the box
stores, most of them anyways, are not built for repeater duty. Once
again, depends on what you need.

>

There is a height restriction on how high an antenna can mounted above the ground/building/tree it is mounted on for small base station/control station. But hey if the building is 1000' tall your antenna can be 1020'.

95.51 Antenna Height(b) The antenna for a small base station or for a small control station must not be more than 6.1 meters (20 feet) above the ground or above the building or tree on which it is mounted.

Sorry if this is a duplicate, I may have replied from my "work" address which is not registered with the group...

Ooops...I just called someone "in the know" regarding paragliding radio frequencies. So here's the correction, the USHGA (United States Hang Gliding Association) is authorized to issue permits to communicate on a handful (I believe he said 5) frequencies that are on a business band (151.XXX MHz). There is certification involved and one must purchase a non-programmable, crystal controlled radio that is tuned the the USHGA frequencies only. Sorry for the confusion (I'm still learning :)), these are not on the 2m amateur band...

Adam:

Portable repeaters are pretty expensive. Don't think you would want to to risk leaving it on a hill and expect it to be there when you got back. Also, it would need batteries that you would need to pack in that would be pretty heavy.

A better solution might to be to investigate installing a dual band Mobil Ham set in your vehicle. If you get the correct one, they can be setup to work as a repeater between your hand held and another repeater. This way you can park on a hill and lock it up. You may need to add an extra battery to your vehicle to insure that it is going to start when you get back.

Subject: RE: [GMRS] Re: Newbie - w/ questions

Hi Chris,

Thanks for the info. The people at base camp would more-likely-than-not be family members which, if I'm not mistaken, the GMRS license covers it. Likewise, if I decide to go ham, I think my wife would take the technician test as well so we'd be covered (she's way into camping and hiking, but not too into real technical stuff that usually involves abrasions and rapelling into cold stagnant water-filled pools when descending slot canyons). From what I've heard around the paragliding community, they mostly use the FRS band (for ridge flying where's there's very little distance and great line-of-site) and a specific HAM frequency that (from what I've been told) does not require a license. Those pilots without an amateur license end up buying a special HAM radio that is "hard-coded" and does not allow frequency change. Thos pilots with amateur licenses end up using programmable radios.

No real interest in radio as a hobby (no offense), more as a tool for communication while engaging in other hobbies (although I've been known to get obsessed with "toys"). So.I'd like the most distance over varied terrain. Licensing issues aren't really a problem, whatever choice I make, the proper licensing will be done.

Any more suggestions? Is it possible to pack a semi-portable repeater during a trip and drop it off at a halfway point, then pick it up on the way out? Or is that idea ludicrous? I'm still very undecided. I have four of what I've heard called 'bubble-pack' GMRS/FRS radios that I've been using for ridge flying. I'd like a better solution since I've noticed how poorly little handhelds perform over anything other than line-of-site or when you have plenty of altitude/elevation in relation to the party you're talking with. Does the same apply to more expensive radios and/or portable HAM radios?

Thanks,

Adam

Adam,

Instead of everyone telling you just to get a ham license, because
thats what hams do, what do you need for radio comms? Are you looking
to talk to other hams, or what? I would imagine while you are
communicating with "base camp", who's going to be on the other end?
Most of the excursions you talked about require other people with you
for obvious reasons. Will they be getting ham licenses too? Would
they take the tests? If so, great! If they would not, would they be
willing to shell out the $$$$ for the GMRS license?
What I'm getting at, is what do you plan on doing with your radios?
Is it for while you are out mountain climbing or hiking with friends,
or is it to talk to your wife, or is it to meet new people?
You said:
>I would be using the
> radio primarily for mountain flying (on a paraglider) and would also
like to

Remember the target, audience, or parties on the other end of the line
if you are specifically going to get a license for these activities.
Just my two cents worth...

Chris

I'm surprised you don't know this.
In a nutshell...
GMRS: Need License : Personal comms only : Can use high power & rptr : Have a choice of frequencies to use so if one is busy, use another : GMRS radios can be bought in retail stores.

MURS: License not required : Business & Personal OK : Low Power only 2 watts & no repeater or interconnect : Have a choice of several freqs to use. Radios not typcially found in stores (anymore) but can be found in industrial supply houses or hardware stores sometimes for more than $100 each radio

Business Band: License required (more exp than GMRS): Business OK, personal not OK unless you described the intended use of the station in the application and it's approved : Can use only the power approved same for repeater : Can only use the freq(s) you are assigned and assignment by a third party company is required unless you apply for an intinerant frequency like 465.5 If you are on the same freq as a busy hotel across the street, tough luck : Radios are not typically found in stores but instead must be bought from a radio dealer or used from ebay and programmed for your frequency and power.

What you described for use for hangliding sounds the same as what I read a while back for hot air balloons. I can't remember the frequency (somewhere in 151 but I think it was what is now license free MURS. And I think the requirements for the balloons was pre MURS.

LMRS = Land Mobile Radio Service
Covered by FCC part 90
Police/Fire/Business/Industrial radios
Powers above 100 watts possible
Licensed by site and number of mobiles/portables
Frequencies need to be coordinated by a service company
10 year license
Can cost $100's, sometimes $1000's to get a license

MURS = Multiple Use Radio Service
Covered by FCC part 95 (just like FRS and GMRS)
5 VHF (15x.xxx) frequencies
2 watt radios, narrowband modulation (GMRS is wideband)
Licensed by rule (just like CB's, FRS, Radio Control)
No coordination

GMRS = General Mobile Radio Service (formerly Class "A" CB)
Covered by FCC part 95
8 UHF frequency pairs for mobiles/bases/repeaters up to 50 watts
8 UHF frequencies for portable only up to 5 watts
Licensed to individual/ covers immediate family
No formal coordination
License good for 10 years, costs $85 (? got mine when it was $75)

To qualify as a SMALL BASE STATION (caps for emphasis), the 20' rule applies. But for a repeater or regular base station, the 20' rule is moot...only the FAA registration and regulations apply. Other things are also incorporated for the small base station category...power, frequency stability, etc.

DingoTel 2Way Enables Free Conversations Over the Internet Using
Two-Way Radios

Wireless Voice Alternative to Instant Messaging

LAS VEGAS, Jan. 6 /PRNewswire/ -- Dingo Inc., creator of the free DingoTel
Internet telephony service, today announced the availability of
DingoTel 2Way
Internet Adapter for two-way radios. With DingoTel 2Way, radio users
can talk
for free over the Internet to anyone else on the DingoTel peer to peer
(P2P)
network. It works by connecting almost any Family Radio Service (FRS) or
General Mobile Radio Service (GMRS), or business two-way radio to a
computer
and then transmitting the user's voice over the Internet via a Voice
over IP
network (VoIP) in real time. DingoTel 2Way enables users to leave their
computers and roam to the maximum range of the radios.
The DingoTel 2Way adapter plugs into a standard USB computer jack. A two-
way radio that supports an earpiece and microphone connects to the adapter
using the provided cable. DingoTel has worked with Giant International to
launch a product that supports a broad range of radios and market
applications. The Motorola Talkabout(R) series of radios have been
extensively
tested with DingoTel 2Way. The 2Way software works like most instant
messaging
(IM) programs using a buddy list. All that is needed to add friends and
contacts to a buddy list is the intended contact's email address. The
software
uses voice recognition to understand commands, so users are free to
pick up
their radios and move away from their computers. With long distance
two-way
radios, users are able to get many miles away from their computers and
still
communicate via the Internet to anyone on the Dingo Network anywhere
in the
world - for free.
College students and teenagers will enjoy being able to chat with their
friends while away from their computers. Active kids can even venture
out into

their neighborhood with their two-way radios and still call their buddies to
join multi-party conferences, across the country or around the world using
DingoTel 2Way software. DingoTel incorporates text to speech technology in its
instant messaging, making mobile instant messaging a whole lot of fun!
The DingoTel 2Way adapter is packaged with a connecting cable compatible
with all Motorola Talkabout two-way radios and other major radio brands.
Manufacturer's suggested retail price is $79.99. Dingo Inc., with offices in
Atlanta, Georgia, offers a free PC version that can be downloaded on the
Internet at http://www.dingotel.com . DingoTel's service allows anyone in the
DingoTel network to communicate for free using a VoIP headset, a two-way radio
or a DingoTel Telephone Adapter, for unlimited talk time.

SOURCE Giant International
Web Site: http://www.dingotel.com

Here we go again...first bubble packs, then Garmin, now this...

Probably not legal on FRS. The rules prohibit connection to "any apparatus".

Maybe not on GMRS either -- there is a prohibition from connecting to a
wireline network somewhere in the rules.

Two potential problems with this...

95.141 Interconnection prohibited.
No station in a GMRS system may be interconnected to the public switched telephone network, except as and in accordance with the requirements and restrictions applied to a wireline control link (see 95.127).

95.194 (FRS Rule 4) FRS units.
(c) You may not attach any antenna, power amplifier, or other apparatus to an FRS unit that has not been FCC certified as part of that FRS unit. There are no exceptions to this rule and attaching any such apparatus to a FRS unit cancels the FCC certification and voids everyone's authority to operate the unit in the FRS.

The "apparatus" must be an RF emitting device. Since this DingoTel device is not an RF emitter, it does not fall under FCC jurisdiction and is therefore legal to connect. However, you cannot connect either FRS or GMRS to the wireline network, therefore it is forbidden under regulation.

For a change, I'm going to agree that this system doesn't conform with the rules on a number of levels but I think the rules should be changed to allow it because I think it's a good idea.

Before the naysayers come in and say it would clutter up the frequencies, another way to look at it is that for GMRS, a VoIP connection is a good alternative to a repeater. Here's an example. A family wants to be able to communicate with Pops at his office 20 miles away to the west and with Mama who's office is 20 miles to the north. When the rest of the family comes home from school, they can communicate with both Pops and Mama just as they would with a repeater but without having the expense, equipment and most importantly, not tying up a pair with a mediocre coverage of that 20 mile distance.

It can also be applied to users of the business band and now with the increasingly popular wireless broadband services such as Verizon, the possibilites are becoming endless. Here's an example as it would apply to a business user, not GMRS. There is a developer who wants to communicate with the sales offices at 3 different subdivisions, each one 50 miles from the developer's office in separate directions. Since the developer doesn't want to pay for nextel for each person and since he was able to buy some used motorola radios cheap on ebay, and since the sales offices already have a broadband connection so they can operate their VoIP phones, the VoIP radio system would link everyone together reliably for less money, and would only tie up frequencies at and around each office rather than over an entire city.

Repeaters are not becoming obsolete, they already are obsolete for a number of users who don't realize it.

The FCC regulates telephone and cable also. It is the Communications
Commission, and its jusridiction DOES fall under these. The FCC goes
beyond RF emitters....

It may not be able to regulate the software by itself, but it can
regulate what is done with it. There is some jurisdiction here.
Hopefully they can stop this.

Chris

didn't we just go through this thread a couple of
months ago?

I still maintain, just because it is VoIP, does NOT mean
that it is going through the PSTN.

Remember though, you do NOT need to have any
connection to the PSTN wireline network, in order
to use a VoIP connection.

I would 100% agree with your statements IF Every Single GMRS user was licensed and properly followed regulations!

If you listen to the GMRS frequencies you hear a mess of call-tones, horseplay and business use..... by people who are not licensed.

Since becoming licensed I have never once heard a person ID.

Use of this VOIP technology will very likely add to the chaos caused by unlicensed users.

Use of this technology by licensed users would be absolutely fantastic. IF this technology is deemed legal, I may be tempted to use it myself. It would be strictly controlled and reasonable steps would be taken to eliminate unlicensed users.

If you are using a telephone line at all, then you are using said
network. If you say, have a satellite ISP connection, then you
aren't.... or a broadband connection via coaxial cable.

My DSL service uses the telephone system. It goes through all the
systems, switches and so on and so forth that any voice call does.

I cannot see a difference.

I do admit I may be DEAD WRONG. My technical knowledge is limited in
this area.

Nonetheless... we will wait for an FCC ruling.

Define telephone line. Just because MCI, Qwest, SWB, etc provide
me with a service, does NOT make that the PSTN. They may provide me
with a dedicated service that is totally seperate from the PSTN.

I may decide to take that service, perhaps a cloud, and do VoIP
over that circuit. I do NOT have to be connected to the
internet, nor the PSTN, in order to use the protocol known
as VoIP. It is strictly a protocol, which does not require the
use of the internet.

9583. Authority to opperate.

"95.194 (FRS Rule 4) FRS units.
(c) You may not attach any antenna, power amplifier, or other apparatus to an FRS unit that has not been FCC certified as part of that FRS unit. There are no exceptions to this rule and attaching any such apparatus to a FRS unit cancels the FCC certification and voids everyone's authority to operate the unit in the FRS."

The key part of this is the last part of the paragraph, it VOIDS the type acceptance/certification and the authority to opperate.

A couple of people in So. California are facing $11,000 fines for this very reason. (attach any other apparatus to FRS radio)

And this very simmular wording appears in the rules for MURS, if the equipment is not type accepted AND certified for use in the MURS, the authority to opperate is revoked.

If it has a BNC connector, then go to www.hamradio.com and look for a good rubber-duckie antenna made for the 440 band, or the 460 band if lucky.

If it has a PNC or mini-UHF connector, then you'll need a special part or adaptor for those types.

I'd say to call Cobra and get a replacement antenna. They're only about $5 each. Either way, if you're replacing an antenna that wasn't meant to be there, then research and very good understanding of HT antennas can be a good thing to try. They're alot different than mobile or base antennas in the way they receive and transmit, due to their size and variance in the way they perform.

Good luck finding one!

It's just like with vehicle accessories found in many stores, i.e. exterior colored lights, sounds, etc. It's legal to sell them, but it's illegal to operate and use them.

Also like here in CA, where most people have covered their license plates with a shaded plastic to help keep them looking "like new". Illegal as well. (it's helpful when u have a sheriff as a friend)

Speaker mikes are PERFECTLY LEGAL. to use on any frs or gmrs unit.
Speaker mikes are not required to be type accepted as they are not an
RF emitting device. Speakers, mikes, battery packs, antennas all need
not carry any type acceptance.

I posed this question to the FCC years when the FRS regulations were
being debated.

You're probably right. I don't think it will solve the problem of unlicensed user's and their RF mess that they create but it is beneficial to those who play by the rules. It's like banning chewing gum in a classroom because a few people stick it under their desk.

9590. Site Re-location

Hi guys,

I have an interesting question and topic to discuss for you. I found an abandonded Nike missile lauching site (1 of 55) here in the bay area. It was originally operated by the United States Army (1938-74), but was abandoned and the
National Parks Service took over. It's now reserved as part of a butterfly extinction program and located on one of many public hiking trails in that area.

From what I've understood over the years, I am able to build a repeater site on their property, as long as the repeater is permitted to be used as a public
and/or emergency repeater for the city or community.

Once (and if) I receive permission and a permit from the NPS, I will have a nice 45w repeater on top of a 995ft mountain serving the bay area.

My question is: Has this ever been done before, and what is the outcome of it's use? Has anyone ever had problems in doing this kind of work? And what materials can I find to make my units secure (ie metal box with lock, etc)?

It will be located inside a locked cement building, which was part of the barracks of this site.

Thanks for any help in advance,
Ryan

Ok then this USB Dingotel device does not appear to be an RF
emitting device, so one could argue it would be just like attaching
a speaker mic and that would be legal. I am not for or so against
this DingoTel device but it sure sounds interesting..... Heck I
could use/monitor my repeater at my work pc...

The device itself is legal. It's nothing more than an accessory cable which you can even make yourself. But it's the practice of using the Internet to relay radio xmissions that is raising eyebrows.

I'm new here and have been monitoring the discussions for a few days. And I have a question I'd like to kick around in respectful debate.

My gf and I are avid rv'ers and we take long treks.

For us FRS/GMRS radios are both a godsend and indispensible for what we do. First, it alows us to maneuver the rv around in places where it would be otherwise impossible. Second it allows us to split up the chores .. one tends to the laundry while the other does the marketing and frequently, she is interested in places that I am not (something about gf's ... mine is into shoes :) lots of shoes :) ... anyway the list goes on and on.

radio traffic between us is usually in short bursts ... "done here .. you ready?? ... ok, meet you in front of ..."

We use the so-called "bubble pack" radios. Motorola 5920's to be specific.

Ok, lets say for the sake of argument that no adult wants to hear children go on and on about the latest craze in "head banger" music and so-on .... and we all agree that that is an abuse of the intent of GMRS ....

Is the general idea of FCC licensing "I've read the rules and Im a responsible adult ... and have no desire to be a nusience to my fellow radio users ...." here's my $75 and may I join the club??

Also, about the "bubble pack" radios .. the 5920's suit our purposes wonderfully - though If I were doing something seriously life or death, like an expedition on Everest, I'd probably insist on I-Coms.

Besides being widely available to those who probably should not have them to begin with .. is the percieved animosity (well, I sort of percieve it) toward bubble pack radios really justified??

Please understnd that I ask these questions respectfully :)

Sincerely

Will

The license fee is $80.

Yes, the animosity is justified. But it is more of a "hate the game, not the player" type attitude. The blame goes more on the manufacturers than to the consumer.

Still, all consumers are expected to be responsible enough to get licensed and follow the rules.

My GMRS usage is strictly with the "bubble pack" type radios.

Not everyone can afford expensive commercial equipment. You also must take into other considerations. Those of us who are married know these other considerations :)

I am licensed and follow all regulations, including proper call sign usage.

If other GMRS users are licensed and follow regulations, who is to tell they are using a "bubble pack" radio.

Your question is fully justified.

Thankyou :) <GRINZ> ... yes, I intend to license mine :)

It was just that we were very happy with our 5920's

From my past experiences .. you aint seen nothing till you ride up on
a little plastic honda motor scooter (wearing a helmet no less) and
park it in a row of Harley's. They said "Son, you got stones!!"

Hi Guys,

Anyone have any idea where I can find a manual or schematic drawings of the Midland 70-1526B mobile radio? Also would like to know where I can get the programming cable and software for a very low reasonable price (or free).

Thanks,
Ryan

Hi guys,

I'm wondering if there's a way to control a switch so that when it receives a signal or small voltage it opens the switch. Then when that signal or small voltage stops, it closes the switch.

The reason is, I have two mobile radios that I'm trying to connect to make a repeater, and the only way of doing this is to connect the mic/ptt leads with the other, but don't want the radio to TX non-stop. I'm sure there's a way of bypassing this so that they work together, but have no idea how or even where to look. Any thoughts would be most helpful.

Thanks,
Ryan

I bought mine off of eBay for less than 40 bucks. Works great and I have 3 of those radios. I don't have the manual though...they are pretty old.

Hi guys,

I am new to GMRS. I am currently waiting on my FCC license. I applied on 2/20/05. I have been in radios for three + years as a radio dealer, and user with Fire Departments and so on. I put a VHF repeater in the area that I live (Murphy, N.C.) I would love to get a GMRS repeater up in this area, as I dont think there is any up in the western most tip of N.C. I would love to meet other GMRS guys in the area and possibly, go in with them to purchase a repeater. I already have the mountain top, power, and antenna. Just need (A) some help financially with the repeater and (B) someone to talk to when I get it up. Any suggestions on how to meet some folks in my area?

We now have a new group on yahoo for those of us in Vermont who are communications buffs. The group is a resource for information on "Police" Scanners, FRS GMRS Walkie Talkies, Shortwave Radio, Marine Two-way Radios, Ham Radio, etc.

Topics of discussion are open to anything of interest about this ever expanding hobby and its history.

If you work in a police department or work / volunteer in a Fire Department or Ambulance Corp. then you are an asset to our group and a special welcome goes out to you!

PLEASE, join us our group at :

Hi Chris,

So do I, and all three are programmed the same, but the audio doesn't work. Any idea on how to solve that problem? Which is why I decided to make them into a repeater. That's where my other email (signal controller) comes from. There's a way to connect them, but don't want them TX'ing 24/7 non-stop. =c)

Any thoughts on this? Or how to re-program them or where I can get them re-programmed? Life is tough, but this has got to work.

In principle, this is a VOX (Voice Operated Switch)or
Carrier Operated Relay type of function. It will
activate the transmit radio when the receiver
unsquelches. To go one step further, have the transmit
controller only transmit when a tone is received.
Beginning to sound like a repeater controller . . .

Now it comes down to how much you would like to spend
on such controller. Hamtronics is one place that I
know of that has some relatively cheap parts to put
together a a Carrier Operated Relay and CTSS/PL
decoder.

I think that's generally the way it goes on GMRS. Of course, you're leaving off the callsign ID at the end of the series of transmissions.

>SNIP<
> Is the general idea of FCC licensing "I've read the rules and Im a

I don't speak for the FCC, but I think the general idea is that GMRS is a licensed service, so you pay your fee and get your license.

>
> Also, about the "bubble pack" radios .. the 5920's suit our purposes
> wonderfully - though If I were doing something seriously life or
> death, like an expedition on Everest, I'd probably insist on I-Coms.

Louise and I have always used only bubble packs for FRS and GMRS. I read the comments by people who buy pro-level radios talking about how they used their radio to hold the truck off the ground while they changed tires, hammered in the fateful spike to hold the rail in place, preventing a derailing, and so on. Louise and I use ours for communication, so bubbe wraps work just fine for our needs. (As an aside, if we were mounting an expedition to Mt. Everest, we probably still would use our existing GMRSes, but we'd bring a lot more batteries.)

I'm not going to worry about the bad rap bubble wraps get. They suit our needs just fine, and we aren't going to spend the money for pro-level units.

If you don't have your GMRS license yet, go to the FCC website, fill in the forms and pay the fee with a credit card. You get immediate privileges using your phone number as your temporary callsign, with the real callsign issued in a day or two.

If you've paid your fee, download
http://www.fcc.gov/Forms/Form605/605f.pdf
and use that as your license till you get your callsign (although I'm betting it's on the FCC site by now).

> I would love to meet other GMRS guys in the

You've already got direction to
http://wireless2.fcc.gov/UlsApp/UlsSearch/searchLicense.jsp
and instructions on how to do the search there for ZA over at Popular Wireless, and I think that's the best suggestion.

Have fun and good luck,

Phil

I found that GMRS.org list is very limited in the number of repeaters
shown. Some states show none. It's up to those repeater operators to
list but they mostly don't.

Depending on what model radio and/or what style connector, the connector you need might be ask close as the nearest radio shack.

Insufficient information.

Which /\/\ earphone? That goes on what /\/\ radio?

And when you say "standard" do you mean a 3.5 mm phone plug?

(This is just for listening to the radio, not talk, right? That would be a headset, not an earphone.)

It may be cheaper/easier to just buy an earpiece with the correct connector. Rat Shack has a couple for $3.99.

Walter

WRITE IT IN STONE! the Micor, at least those with the Transmitter FCC Identifier of CC4224C are Part 95 type accepted. This is the tranmitter on my Micor Community Repeater.

Here is my journey to this data.

I had sent a letter to the FCC Field office back in Dec. requesting to know if the Micor Community Repeater I have on the air was certificated for use in the GMRS as it states to do in the GMRS rules. I also checked with big M and they no longer maintain or offer data on non current radios. I waited a few months for word from the FCC and after I didn't receive a reply, I contacted R.H. to see if he could help. He did some hunting came up empty and he then referred me to someone and so on and finally I ended up with an EE who assisted me. Well as most of us know the older equipment prior to late 1981 are not contained in the OET database. The FCC does not maintain publicly available records of any equipment before this point so if it doesn't have the current style ID (Grantee Code/Product code) you will be hard pressed to find the authorization data. The EE had a copy of the "FCC Radio Equipment List" dated January 1, 1983, this is where the proof is. On page 302 in black and white the transmitter CC4224C is authorized for rules part 21, 90 & 95. If any one has one of these lists keep it! I will scan the info later tonight and post it on my website, the link will be www.digio1.com/cgrg/micor.html try it later tonight or tomorrow. There are other Motorola transmitters listed on that page that are Part 95 also that people might be interested in.

The reason I say "Write it in stone" is because sooner than later
the pre 1981 documentation will be gone forever. I was lucky to
finally find someone who had the needed information. I didn't settle
for "its not part 95 because its not in the database. I guess if
that was the case then its not part 90 either.

When they first came out there was a set of business freg. in them about 467.800 to 467.950 area. After they were out for a bit Maxon got us dealers how ask for it the software so we could change they. Well I had one user that had all his set in the 469.4xxxx area. If you find someone with the right software you should be able to get your GMRS out of the radio's use the same cable for the SP-120 radio's.....

thanks John

T7100 is the same as the T7200 (UHF, 7 FRS, 7 FRS/GMRS, 8 GMRS, 8 GMRS Repeater freqs), but without the 8 GMRS Repeater freqs.

Thanks for the info. I just figured the radios are programmed in the 448-456 MHz range. I thought the "G" model was preset to GMRS, but maybe that's just its default setting, and this one has been modified. I guess I'll drop by my local radio shop!

Still can't figure out what holding down the monitor key while powering on does...

Thanks

David

If that doesn't work, do a search on Google for your model number and the word "manual". Lots of websites have info on programming radios, if they are newer than the old ones.

From: k45827
Topic: 9627 Message: 9627

Don't known how I did it but I broke the pin off the radio end of the cable. Anyone know if a source for just the cable and not the software? It much easier to program in CTCSS/DCS & freqs with the software than via the keyboard & I can use 99 channels configured differently..

Thanks

When you do the monitor key it get it in the read or program mode just by the number of flashes on the led. you still need the software and cable to do the programming. I think the range on the radio is 450 to 470. the "G" is only part of the model number it is for GRAY the color of the first units. They are also mostly the same as the 120 but the 120 are black. Almost the same board a lot of the same operation just little changes. Good luck.

John

It's starting to make sense now! Thanks for the information.

So I guess the next step is to either buy the software & cable (anyone
any idea where to get it and how much - I guess it's the SPK-400C) or
take it along to the radio shop

9630. Cobra PR 1000 problems...

Yahoo group: GMRS (2005 — 2007)
Date: 2005-03-07 04:50:42 UTC
From: waone28
Topic: 9630 Message: 9630

Hi all,

I have 1 pair (2 radios) Cobra PR135 22 channel FRS/GMRS and 1 Cobra PR1000 GMRS radio 15 channel. I tried to communicate between these radios; I set the channels on all radios to be channel 1 and CTCSS/Sub Channel to be 0 and the distance to be 5 meter between the radios. The communications between PR 135 were very good and clear but I had a problem when trying to communicate between PR 135 and PR1000. My both PR 135s can receive the signal from PR 1000 with unclear signal or rough signal on the other hand my PR 1000 could not receive any signal from my PR 135. I tried to monitor the communication between PR 135 using my HAM radio on the same frequency (Yaesu VX-1r) and I could listen/monitor on PR135s very clear otherwise I was not able to receive the signal from my PR 1000 on my HAM radio. Are there any problems with my Cobra PR 1000 ?
Thank's

-budi-

Try eBay or just repair it yourself. Take the cable apart and re-do the pins, or stick a short part of a paper-clip into one end. But since most would disagree with much of what I just said, I'd say to try eBay or Google first.

Do you have to Identify with your call sign durring your transmisions or conversations?

Also if someone is useing a GMRS frequency and your try and share that frequency can they demand and make you use another frerquency? Does any one OWN a speciffic frequency in certain areas or is there a regulatory body that controls what frequency you can use?

Yes, you must ID once every 15 minutes and at the end of your conversation.
>
> Also if someone is useing a GMRS frequency and your try and share
> that frequency can they demand and make you use another frerquency?

They can ask. You can refuse.

> Does any one OWN a speciffic frequency in certain areas or is there
> a regulatory body that controls what frequency you can use?
>

No. Not anymore. You used to have to license to use only two frequencies or so. You could only use the frequencies you were licensed for. This requirement was dropped.

I have the PR1000/PR2000, and I like them. I don't know anything about the PR135s, so my first question is whether their channels are assigned to the same frequency.

If so, then my next suggestion is to try a frequency counter and see if one or another of the radios is off frequency. This happened to the PR1000, but it was fixed under warranty.

You can use any frequency on simplex! You can not access someone's repeater without permission! They can't charge you for their repeater services, but can take or ask for donations. Bill WPXA276

Hello Ryan
Thank you the paper clip worked fine. Cut it to length of approx
9/16" and inserted into the barrel... I'm still trying to figure out
how I broke it off in the first place, but now that I have a sure
method of replacement I won't have to worry!!!

Ken

Guys,

You can use the same channel. But, be courteous when using the radio and wait until a pause in conversation. No one owns the airways except the FCC.

Suprised, but you're very welcome. Seems like the most simple things in life are the easiest ways to fix something. Be creative or use duct tape. You should see my electronics junk drawer. Lots of cool things built with household items. Including a TV antenna made with a paperclip and a metal hanger.

Hi, Jay,

If someone is using a GMRS frequency and you try to 'share it,' they may ask you to try another frequency. My suggestion is that you not try to share it at all, if there are other frequencies available. (And there usually are.)

No one owns a frequency -- that means them, and it also means you. I would ask you to read the GMRS rules, which are located at
http://www.access.gpo.gov/nara/cfr/waisidx_03/47cfr95_03.html
and particularly Rule 95.7, which is located at
http://a257.g.akamaitech.net/7/257/2422/05dec20031700/edocket.access.gpo.gov/cfr_2003/octqtr/47cfr95.7.htm
and which deals with harmful interference. It _may_ be that by trying to 'share' a frequency
you are causing harmful interference. The other persons and you should cooperate in sharing the frequencies and in reducing interference.

I believe that means that if a frequency is in use, you should try another one rather than trying to 'share' the one in use.

Phil

Which also means (in a shorter version), that if your radio has PL codes available use them instead. You may stay on the same frequency (not channel - major difference) with the other person, but maybe use different sub-tones or codes.

No one can say or tell you how to use your radio if it's on simplex (462.xxx). However, if it's on duplex (467.xxx) and a repeater owner asks you to not interferre with their station, then yes. But I don't believe that's the case.

Anyways, whatever happens, the best of luck to you and your radio operation.

MAXON GMRS 210+3 radio
includes radio, wall wart charger, manual , regular antenna and stubby antenna. Can be programmed to work on GMRS repeater or simplex.

Asking $75 or best offer.

Ritron RTX450 11 Channel/scanlist UHF Two way Radio
includes rapid charger and speaker mike.
Radio working when taken out of service.
Battery pack needs replacement or repair- at least 1 bad cell.

Will program for your business/gmrs channels before shipment.

Contact via email stmills@... or message at this forum.

The Hummer Radio was put out by Radioshack last year. Owners manual can be downloaded on their site. They area also able to repair the unit if need be, however I don't think you will get them to let a schematic go.

Mathew

From: Justin Bentzinger
Topic: 1016 Message: 9658

Does anyone have a reference, link, or other reference to find two rules from the FCC?

1. Narrow banding deadline for UHF
2. License requirements for UHF, I have a police chief telling me, and anyone that will listen, that the Police can just make up a frequency and place it into operation, because, well, they are the police. I need a rule number if possible.

Thank you in advance, I have difficulty finding what I am looking for on the FCC site.

Here maybe is the answer to #2 from the Part 90 rules.

90.20(f)(5) A Police licensee may use, without special authorization from the Commission, any mobile service frequency between 40 and 952 MHz, listed in paragraph (c)(3) of this section, for communications in connection with physical surveillance, stakeouts, raids, and other such activities. Such use shall be on a secondary basis to operations of licensees regularly authorized on the assigned frequencies. The maximum output power that may be used for such communications is 2 watts.
Transmitters, operating under this provision of the rules, shall be exempted from the station identification requirements of §90.425.
Use of frequencies not designated by a ``PP'' in the coordinator column of the frequency table in paragraph (c)(3) of this section, is conditional on the approval of the coordinator corresponding to each frequency.

9662. Re: FCC Rules

Yahoo group: GMRS (2005 — 2007)
Date: 2005-03-25 19:17:11 UTC
From: Ken
Topic: 1016 Message: 9662

Justin,

Having just gone through the nutroll getting a license for a fire agency, I can at least answer part of your question.

All public service frequencys have to be coordinated through a freq. coordinator that has FCC authority to assign frequencys for that service. The department doesn't get to choose the frequencys either, the frequency coordinator assigns the frequency, the department does get to specify which band or bands they want the frequencys in thats all. The frequencys that are available to public service are listed in CFR 47, and coded for the intended service (PP for police, PF for fire ect). The police department can't just use whatever frequency they want just because the are the police!!

If they are violating the regulations, they would be subject to the same fines as any other illegal operator, and if they were interfereing with my operation on GMRS I would first educate, if that does't work then document and report the violation to the FCC.

Ken

Well, sort of. Normally one contacts the frequency coordinator, and gets a list of possible frequencies, to monitor beforehand. This is normally done after the coordinator gets the license app. After monitoring, and checking, one contacts the coordinator and advises them which of those frequencies they want. The can also designate the frequency in instances of mutual aid channels, county wide channels, etc.

Exceptions can be granted for use of PD in FD frequencies, as well as any other group of frequencies, normally having to go through that groups frequency coordinator for extra coordination and a waiver.

I trust you will have seen the numerous posts about the "law Enforcement Exception", and now understand the exemption that allows law enforcment to be able to channel hop - within limits.

Doug,

Does the frequency have to be on the list of paragraph (c) (3) or is
it all of them?

Chris

Chris,
Yes there is a list. Also I had pulled that off of a post at popular wireless, that must be an old version, here is the latest version of 90.20 (F)(5) A Police licensee may use transmitters on the frequencies indicated below in connection with official police activities without specific authorization from the Commission, provided that such use shall be on a secondary basis and shall not cause harmful interference to services of other licensees operating on regularly assigned frequencies, and further provided that all such use complies with the requirements of Federal, State and local laws. The provisions of Sec. 90.429 shall not apply to transmitters authorized under this paragraph. To be eligible for operations in this manner, the transmitter must comply with all of the following requirements.
(i) In accordance with Sec. 90.203 and Sec. 2.803 of this chapter, the transmitter must be of a type which has been certificated by the Commission.
(ii) The carrier frequency shall be within the bands listed below and must be maintained within 0.005 percent of the frequency of operation. Use on assigned channel center frequencies is not required.

30.85-30.87 MHz
30.89-30.91 MHz
30.93-30.95 MHz
30.97-30.99 MHz

From: kvsp1160@aol.com
Topic: 1417 Message: 9667

Sorry Keith,

Both are old and the GMRS site is never maintained. I'm actually not too sure of the directory being published, but from experience with this and other groups (and many discussions) the GMRS directory site is not worth much, and am never aware if the systems are still active or have been shut down since their last posting.

There is however another group on Yahoo that deals with just the topics of repeaters and it's subjects. It also has an online database with many repeater info as well. Great group to be a part of I might add!

Police use of frequencies,

1. They can ONLY use frequencues on the list.
2. They can ONLY use them on a SECONDARY basis, meaning that if another licensed user is on that frequency, the police have to allow that person to use the frequency, and they, the police, have to find another frequency.

Chris,
Yes there is a list. Also I had pulled that off of a post at popular wireless, that must be an old version, here is the latest version of 90.20 (F)(5) A Police licensee may use transmitters on the frequencies indicated below in connection with official police activities without specific authorization from the Commission, provided that such use shall be on a secondary basis and shall not cause harmful interference to services of other licensees operating on regularly assigned frequencies, and further provided that all such use complies with the requirements of Federal, State and local laws. The provisions of Sec. 90.429 shall not apply to transmitters authorized under this paragraph. To be eligible for operations in this manner, the transmitter must comply with all of the following requirements.
(i) In accordance with Sec. 90.203 and Sec. 2.803 of this chapter, the transmitter must be of a type which has been certificated by the Commission.
(ii) The carrier frequency shall be within the bands listed

below and must be maintained within 0.005 percent of the frequency of operation. Use on assigned channel center frequencies is not required.

From: Bruce Jordan
Topic: 1016 Message: 9669

One important thing about the section I found in a very old copy of the part 90 (1978) is that the power used on these unlicensed frequencies must be limited to 2W and be on a secondary basis to licensees on that frequency.

So your police chief can put them in his 2W portables, not 5W, portables and is secondary to the licensed users. The goal was to provide privacy, not interference, to authorized Police Radio Service users. He cannot put it in his mobiles or base station except as receive only.

I will check the latest to see if this has been changed but the goal was to prevent chaos and be able to hide from local scanner listeners who may also be the criminals under surveilance

And, yet, they never listed mine despite several submissions
(perfectly formatted according to their requirements).

As the saying goes..."Your mileage may vary".

I listed my repeater with the gmrsrepeater group here on Yahoo, on
the Artscipub directory, and on a ham radio repeater site:
www.repeaterlink.org .

g-m-r-s.org? I'm still waiting...

The ones in CA. There's one in Morgan Hill and a few in the south bay (nor. cal) that haven't been updated for a few years and are not active today.

Which is why I don't rely on that site anymore, unless they've proven to update it since.

There's been a few complaints in this group about that site not being able to update their info. So we don't encourage others who are new to GMRS to look it up there.

9674. Bootleg FRS

Yahoo group: GMRS (2005 — 2007)
Date: 2005-03-29 06:17:28 UTC
From: jeff daugherty
Topic: 9674 Message: 9674

Hello here in Phoenix,Az. we have a Hotel running a repeater on FRS freq.'s.. output is 462.6125 (Ch 3)
input is 467.6125 (ch 10) on FRS. these are confirmed.

there repeater is getting about a 20 mile coverage area
on the output Ch-3...

I sat tonight in the parking lot of this hotel (greenway and 69th. st) and checked to confirm the input freq.
and of course full scale...

I plan on tomorrow is going back to the hotel to ask who there radio tech is and advise them that they are on the FRS freq.'s both on input and output. (I am sure they know this) and of course I hear no callsigns... plan on collecting data for the FCC in hopes they will do something... they knock out ch3 usage for frs 20 miles in each direction.

>>...they are on the FRS...I am sure they know this...

Don't assume that they already know they are illegally operating. MANY radio vendors place clients on frequencies that they shouldn't be using. Clients rely upon their vendors to get them up and running...Many cases are actually trhe vendors' fault for misrepresentation...

>>...plan on collecting data for the FCC...

Why not invite the hotel manager to lunch and address the situation?

I haven't had to formally complain to the FCC in years on such illegal use of the spectrum. A phone call or two - coupled with a visit over coffee or a meal - can get the job done.

My last "problem" was a large trucking/freight firm on 462.6750 (and another couple of freqs). When I spoke with the manager and explained how to get his ops legal, he was perplexed: "Why, we spent about six thousand bucks on this radio system, we surely would have spent the extra $350-400 for a ten-year business license!"

We both called his radio vendor that day - and the matter has been resolved to everyone's satisfaction: The vendor came out within 48 hours and re-programmed all the radios; the FCC application is in process for a 10-year, low-power biz license; and the vendor will be coming out to re-re-program the radios as soon as the license is issued.

Not ONE call to the FCC was necessary.

Just a thought, but did the FRS band used to ba part of a pair of business frequencies? And they're using those old frequencies with their new system?

Just a thought. They also might be using a simplex repeater (which is still illegal) which is why they're getting out farther.

I'd talk on there for the heck, but am not saying to do so. It would be fun to hear their responses though. =c)

Anyways, good luck with your quest Jeff. And whatever you decide to do (how to handle the prob), try to keep each other happy. It might just be a cheap bubble-pack system... or a two-way radio shop screwed up royaly!

First of all you don't need a license for FRS, and is
it illegal to have a FRS repeater if you are within
the wattage guidlines??, if they are covering 20 mile
area they are probly running more than the legal
limit.

Remember, FMS was set up for 1/2 watt power no antenna mods etc. by running a repeater there using external antenna right there a violation, also power is an issue. and off course no callsign of any type.

9681. GMRS Bootleg FRS

Yahoo group: GMRS (2005 — 2007)
Date: 2005-03-30 02:39:04 UTC
From: Craig
Topic: 9674 Message: 9681

Jeff, Here, like you there is a repeater on
an FRS frequency. It has at least the 20
mile coverage you describe and then some.
Just by listening to them talk, they are aware
their not legal and I also have determined they
are licensed hams. (Go figure) Almost slipped
and gave their amateur call sign on more then
one occasion. They obviously are not licensed
for GMRS. I would love to see them busted and
also have their ham tickets revoked. Keep us (me)
informed Jeff....

Craig

Anyone ever use these radios? There are REAL nice radios..I got mine after bsar told me about them..We use these radios at work and i use them with my family and REACT..They have a realll nice audio sound also...

I am looking for your reviews on the radios..I would suggest to you folks if you can get a pair i got two pairs myself...

Bill

Those are ones I am considering. The reviews look great. Are they repeater capable? I know a lot of these types aren't, but they added this capability to the Garmin Rino 130, so it isn't out of the realm of possibility.

Thanks!

Congratulations Bill! Welcome to the GMRS community!

There are alot of great radios such as the pryme, motorola, icom, kenwood, etc. that you can find to use. I'd suggest to go to eBay and search for commercial UHF radios (kw: uhf mobile / uhf handheld / uhf portable). If you want something really simple and don't want access to a repeater, then go for a bubblepack, but they only have radios up to 1w total, no matter what they say. It's the FCC law. =c)

Also, there's been a good discussion on whether or not your radio has to be type 95 accepted. Most people stick with 90 and 95, while others just use 90. Read the FCC rules at fcc.gov or www.provide.net/~prsg and use your own judgement. Never use a radio that has both ham and GMRS TX on it. We frown on those types.

Feel free to check around on here as well as many of our members might have radios up for sale. But whatever you decide to do, I wish you the best and hope to hear you on the air soon.

Congrads Bill on the license. My call is WQBW873. I also do ham and cb.

The best thing is determine what you want to do with the radio before you buy any. I am in Pensacola, so I have cobra 2 watt and midland 3 watters handy in case of hurricanes down this way.

Take care

Looking for a new set of radios. I currently own the Motorola Distance Radios, and the Motorola model 5930. Both are good radios, the distance are a little too large to clip to your belt, and the 5930 don't seem to have the reach I want.

I would use these for hiking in the woods, so sometimes I need a little more signal to get out there.

Any ideas on which models to look at?

Also where are the best places to buy from?

CB

That's fine from what I know and understand. Just having a single radio with ham AND GMRS frequencies on it isn't the greatest idea.

To be honest, I'm not sure whe we had that discussion about both freqs being on the same radio, but it was around last summer. We can talk about it again to refresh our memories if needed. I just remember seeing that in a rule that the FCC has about GMRS equipment and such. But again don't quite remember when and what of.

Ya, ham is fine to program on any commercial radio with it's own part-type acceptance. I guess the GMRS community doesn't want mixed communications and to have ideas about linked and cross-linked repeaters and the such between radio services.

To me, as long as I keep GMRS with GMRS and ham with ham, then I'm fine and everyone's happy. But hey, why not start a new post asking that question to this group. I'm sure the 1000+ members on here would be happy to say why. =c)
(for those wondering, i'm not on ham... don't worry)

GMRS Radios It's going to depend on how much money you want to spend.

Most of all uhf comerical radios are part 95.

But if you gmrs licesend ok but frs can not use anything with more than 1/2 watt output.

the cost of these other is much higher but you get what you pay for.

Motorola has many radio's cp200 uhf,gp300,gp350,p1225,ht750,p200,sp50,p100,visar.

kenwood has tk350.tk360 tk370 tk380 tk3160 tk3140.

the only thing about all these radio there not user programable. and there higher end radio.

You could buy most of these on ebay for a good price. But you have to find out if ther person can program it before it's ship to you.

The cost on new radios is cover but buying a use one could run from 15.00 to 50.00 just to program it at a radio shop.

Don't think it's bad but I use them and they kick butt compared to the small ones you buy at walmart.

ps: don't try to buy and use ham rigs you will be very unhappy some tx good but rx sucks other only hear good but you will lose disantace.

9697. Re: [GMRS] Digest Number 1355

Yahoo group: GMRS (2005 — 2007)
Date: 2005-04-09 17:59:29 UTC
From: A10382
Topic: 9696 Message: 9697

The Motorola SPIRIT types for UHF (Including the SP, MV, GT, as well as the UHF version of the XTN (XU series) do NOT have any GMRS frequencies in them to select. In fact some of the UHF 'business' freqs are very close to public safety assigned freqs around 461MHZ.

Despite what the ads on eBay say, they are not for personal use, family use, hunting, fishing, hiking, etc. Most of the assigned freqs in the UHF business band require frequency coordination to insure no one else nearby is suing the same.

We had a local hardware store buy 12 XU radios and program them on a freq that was only 7.5kHz from the PD.... The interfered with the PD and Ambulance services UHF system until they were tracked down by a local ham.. Fortunately for the hardware store in that it was fixed without getting the FCC involved.

The VHF radios (MV, XV, SV, and SP-VHF models) do have a few of the MURS freqs (usually 154.57 and 154.6 - the 'wideband' channels). The XTN VHF models (the XV series) also have 151.82, 151.88, and 151.94. However the radio doesn't really meet the narrowband spec for these three. Somehow Motorola got the FCC to waive the narrowband spec for them on these models by limiting output power automatically to only 1W on the XV2x models. At 1W max, the range is short enough so as not to cause much interference to adjacent narrow band channels.

Demand for these radios is HIGH and almost everyone I've seen on eBay has been bid up to more than $100 per radio (a lot for a used radio that probably needs, at least, a new battery and a replacement antenna.

Your mistaken. I own the TK-350, with removal of an internal jumper and self programming enabled from within the software, this radio is indeed user programmable. The TK-370 can be field programmed by using the keypad. I believe from discussions I've heard that the same is true of the TK-380. I know it is for the TK-390, as I own one of those as well.

You are correct on the TK-360, it can be programmed only by computer. I have no experience with the TK-3140 or TK-3160.

I don't know who the WE is you refer to but last I knew hobby radio such as AMATEUR RADIO and GMRS and hobbies in general are supposed to be FUN. Many amateurs mix and match: radio/internet, radio/computers, radio/hiking, radio/fishing, you get the point. So it is more convenient to have GMRS AND AMATEUR frequencies in the same radio. You just don't make a big deal out of it. I use both in the same radio and have loads of FUN. And speaking of fun check out www.qsl.net/nerdnet and you will see that AMATEUR RADIO Operators do have FUN. ENJOY not DESTROY!!!

Modifying a GMRS rig to transmit on ONLY ham frequencies would be perfectly legal. Modifying a ham rig or a GMRS rig to transmit on both ham frequencies and GMRS channels would void FCC type acceptance of the the radio for transmitting on GMRS channels. Of course, it is fun, and it is very unlikely you will get caught. I would not recommend this to anyone.

GMRS is not Hobby radio. The GMRS service is not intended for hobby
use.

Many amateurs mix and match: radio/internet,
> radio/computers, radio/hiking, radio/fishing, you get the point. So
> it is more convenient to have GMRS AND AMATEUR frequencies in the
> same radio.

It is against regulations to operate GMRS frequencies with an amateur
radio. Amateur equipment is not type accepted for GMRS use.

>You just don't make a big deal out of it. I use both in

> www.qsl.net/nerdnet and you will see that AMATEUR RADIO Operators
> do have FUN. ENJOY not DESTROY!!!

In this case you are destroying! Failure to comply with regulations
leads to destruction of a radio service.

By the way.... I didn't catch your GMRS callsign...

Clyde,

Don't get me wrong. I love and fully enjoy the hobby of radio communications, which is why I've been active in many different services for over 8 years. But from what I understand in the GMRS service, you aren't allowed to have both GMRS and ham on the same radio.

Now in case I forgot what I said previously and the above isn't what we're talking about, then refresh my memory and send me another email.

But I enjoy comment and input from others about the services that we have available for us to enjoy and work with, for ourselves and for others.

Hopefully we both can come to a conclusion of what the heck we're both talking about. =c)

Well all you have to do is look for some of the Circle M products if you want to have a type accepted radio that can accomodated HAM & GMRS. Granted these are commercial grade radios like Saber, MT & HT 1000, etc. Mobiles as well.
Moto has a number of models out in the market that have band splits like 403-512 & 438-482
All you have to do is go to www.batlabs.com and look up the radio type & model. In the site they have the model number decode charts and you have the band split as well as other handy info.

As far as I know, there is no prohibition against taking a Part-95-certificicated (formerly called "type accepted") radio, programming amateur frequencies into some channels and GMRS frequencies into others, and using it in both services. What *is* prohibited is taking a non-certificated radio (such as an amateur rig) and using it to transmit on a GMRS frequency.

Even though the former is legal, I have not done so. I have two reasons:

1. I don't want to jeopardize my amateur ticket by putting a radio that can transmit on amateur frequencies in the hands of an unlicensed family member who might inadvertently transmit on the wrong channel.

2. I don't want to risk giving the wrong ID on the wrong channel myself in a moment of confusion.

So for me it's "different radio services, different radios".

Can we let it go now?

here is power output for gmrs

PART 95_PERSONAL RADIO SERVICES--Table of Contents

Subpart A_General Mobile Radio Service (GMRS)

Sec. 95.135 Maximum authorized transmitting power.

(a) No station may transmit with more than 50 watts output power.
(b) [Reserved]
(c) A small control station at a point north of Line A or east of
Line C must transmit with no more than 5 watts ERP.
(d) A fixed station must transmit with no more than 15 watts output
power.
(e) A small base station must transmit with no more than 5 watts
ERP.

9718. Re: WE frown on those types

Yahoo group: GMRS (2005 — 2007)
Date: 2005-04-13 02:14:05 UTC
From: Harold Snyder
Topic: 9705 Message: 9718

I agree that a Part 95 transmitter converted to amateur frequencies would be legal and that an amateur tranmitter converted to GMRS would be illegal because it would not be certificated, but disagree that a transmitter that had capabilites on both amateur and GMRS channels would be legal.

Sec. 95.603 Certification required.

(a) Each GMRS transmitter (a transmitter that operates or is intended to operate at a station authorized in the GMRS) must be certificated.

Sec. 95.129 Station equipment.

Every station in a GMRS system must use transmitters the FCC has certificated for use in the GMRS. Write to any FCC Field Office to find out if a particular transmitter has been certificated for the GMRS. All station equipment in a GMRS system must comply with the technical rules in Part 95.

Sec. 95.621 GMRS transmitter channel frequencies.

(a) The GMRS transmitter channel frequencies (reference frequencies from which the carrier frequency, suppressed or otherwise, may not deviate by more than the specified frequency tolerance) are 462.5500, 462.5625, 462.5750, 462.5875, 462.6000, 462.6125, 462.6250, 462.6375, 462.6500, 462.6625, 462.6750, 462.6875, 462.7000, 462.7125, 462.7250, 467.5500, 467.5750, 467.6000, 467.6250, 467.6500, 467.6750, 467.7000, and 467.7250.

A transmitter modified to operate on other than the GMRS frequencies would no longer comply with the technical rules in Part 95 and would not be certificated. So, such a modified device would violate Part 95 if used to transmit on a GMRS channel. Receiving ONLY would be OK.

Sure, it is a minor offense, and you would likely be able to get away with it indefinitely as long as you don't raise anyone's attention. People speed, run red lights, jaywalk, litter, drink beer before noon on Sunday and spit on the sidewalk all of the time and very seldom get tagged for it.

Bob,

I totally agree with you. Which is why I deleted a ham frequency that I received on my PR-460 (GMRS unit). 1) I don't have a ham lic yet. and 2) I didn't want others to accidently TX on that freq. It belongs to a linked system that TX's across the US from California to New York. =c) Not the greatest.

Like bob said, keep GMRS on it own unit and Ham on their own unit. Easier, and won't have confusion about what's what like this post did.

I think the key word here is "MODIFIED" I use a
commercial Kenwood TK-830 for both GMRS and HAM. No
modifications were required to achieve this. Where-as
you would have to physically modify a ham radio to
allow out of band operation.

9724. Technical Issues Re: [GMRS] Re: WE frown on those types

OK, we've heard everyones feelings on the
(il)legalities - How about the technical issues?

Personally, my 440 radios struggle trying to receive
even the lower part of the band (420MHz) because they
are optimized between 430-450MHz. (Yes, here in Los
Angeles, voice repeaters have been assigned over most
of the 30MHz allocation.) I'm having trouble
justifying the sacrifice of my PA transistors to
operate over such a wide band (OK, my license, too).
Intermod is also a big issue around here.

From: David Wild
Topic: 9705 Message: 9725

I really can't see why a Part 95 certified radio programmed with both GMRS and Ham frequencies (or any other UHF frequencies for that matter) would be illegal. If it required hardware modification that would be different, but pretty much every certified radio I've come across covers something like 430-470 MHz.

Mixing ham and other VHF/UHF frequencies on a certified radio is commonplace in Emergency Management departments, etc. where they need to work on Ham frequencies for Skywarn, etc.

9726. Re: [GMRS] ADI / Pryme PR-460 UHF radio

Yahoo group: GMRS (2005 — 2007)
Date: 2005-04-13 18:12:15 UTC
From: kvsp1160@aol.com
Topic: 9721 Message: 9726

Wally,

Welcome to the year 2005. The Pryme (ADI) PR-460, 144, etc. has been discontinued due to parts that are becoming more expensive, are made in foreign countries, and the Pryme company doesn't have the extended service and time to make new and current models available.

They still make accessories like desktop mics, palm, mics, antennas, etc, but not HT's or other physical unit for communications for GMRS and ham.

Some people out there are selling their PR-460 radios, so you might get a good price. Depends on what comes with it or what condition, they'll range between $80 to $110 for each unit, or might even get lucky and get a good deal for a pair of those.

I own three, one which has a DTMF pad (PR-460-D), and all three are beautiful when they operate. Icom, Kenwood, Motorola, and other commercial radios are also available, but (in my own opinion) they don't have the user-friendly modes that the PR-460 has. If you want more info, I wrote a small article on the PR-460, and can get you a copy. Email me on the side for it.

Good luck with your search. 73's,

Ryan

Topic: 9705 Message: 9727

Now here's where it becomes tricky. Overall, I (personally) will stick to seperate units for seperate services, but definately know that using a amateur radio unit for GMRS is very much illegal...

GMRS needs to be Part 95 type accepted. No exceptions about it.

Amateur Radio has it's own part compliance (which I am not aware of), so using a Part 95 type accepted unit for amateur bands is beyond my knowledge.

I guess what I originally was trying to point out, is that you can't have both GMRS and amateur services on an amateur radio unit. You may be able to have both on a Part 95 unit, but would need to question that based on FCC Part 95 rules and regulations per GMRS usage.

Most folks that have a GMRS community have worked with amateur radio persons in the past and present times with emergencies and other services for their community, but would prefer to keep GMRS on it's own system, with it's own rules, and it's own licensed persons for that service. GMRS is not a hobby, but a service for families and small businesses and groups for short-distance communications when needed.

Please understand that I enjoy the presence of the amateur radio world, but prefer not to mix the two services on the same radio. Just my preference.

73's,
Ryan

Nowhere does it state that those are the ONLY channels that can be in
a certificated radio.
It states that those are the only ones that are authorized for GMRS use.

I personally use a commercial radio (/\/\ Syntor x9000) with GMRS and
my agency's frequencies in it. Perfectly legal.

Yes, the key word is "modified". When I used the term I was thinking of hardware, adding or changing parts, cutting or adding traces or wires, re-tuning etc.

I read on another board that Riley Hollinngsworth of the FCC has stated that in his opinion a radio certified for public service could legally have ham frequencies "programmed" in. It seems logical that a radio certified for GMRS would be ok also.

I don't know anything about that Kenwood rig and have not been able to Google up any specifications. I assume it is certified for GMRS by what you write.

Hi Guys,

Does anyone know of the Motorola MCX-1000 UHF mobile radio? Found a few on eBay, but am unsure of the quality and operation that they have.

Let me know soon as it ends in one day.

Topic: 9747 Message: 9750

CB,

As for answering your question, you can check up at eBay.com for listings. Try keywords like: uhf repeater, 440 repeater, gmrs repeater, uhf mobile, etc. Because the GMRS system is so close to the Amateur Radio's 440 (70cm) frequency, you can find some in that range and then reprogram that unit to your frequency specs. Some good simple units to look for are Ritron, Motorola, Jobcom, and a few off-brands as well. If you want a more sophisticated setup with auto-ID (CWID), timeout timer, community codes, DTMF patches to help control your unit (not auto-patch!), then look for high-end manufacturers like Icom, Kenwood, Yaesu, and new high-end Motorola's.

As far as coax, if you're running a short distance (less than 50ft) then I'd suggest finding a low-loss RG-8 coax. If farther, then look for heliax or LMR-400. Although I've done some research on LMR-400, it seems to me that it's the same as RG-8 and not worth your money. But again, look at the specs and do your own research on coax as well. More shielding on your coax produces a greater signal response and less signal loss.

For base antennas, dipole and yagi antennas are great for TX and RX operations. Again, this depends upon what type of setup you're looking at. To be honest, I'd use a discone antenna for receiving applications, and a dipole for transmitting. If you only want your signal to TX in one direction, then use a yagi. I'm guessing that this would only be for cases if a mountain is blocking the other direction or if you just want to focus your communications in one specific area. Even though your repeater will TX in all areas, one half won't be as strong as the other.

Not sure about pricing, but would guess that it could range between $200 and $3000.

Good luck on your research and your operations of your new (or used) repeater system.

CB,

SUNPCS has a number of UHF repeater packs including duplexers listed on eBay for anywhere from 800 to 900 dollars. If you plan to put up a simple repeater, all you would have to add is a power supply and antenna system to the first one the subsequent ones require additional items be purchased. SUNPS will work with you they are extremely helpful.

Hello to all. I just received my GMRS license today (via FCC website). My call is WQCP729. I have been an Extra class HAM (AF4AY)
for nine years and hold a commercial GROL license as well. I think I now have about every license I can get. I am looking for other GMRS users in Western North Carolina. I plan on using Motorola equipment.

I have a GP300 16-ch and an MT1000 99-ch handheld. I have a mid-power
UHF Spectra for mobile use.

Thanks!!!

Mike

LMR is head and shoulders above RG-8.
Starting with, it's 100% shielded.
And the loss is significantly better.

Times LMR-400 2.50 dB/100 feet at 400 MHz
Belden 8237 4.1 dB

You have to go to 1/2" superflex to get better than that.

Now, on the other hand, I've heard stories from some commercial radio shops that LMR-400 has a bad habit of adding noise in duplexed systems. Probably something to do with the foil /braid contact areas.

Walter,

I think that's what I heard about it which made me think of that compared to RG8 coax...

My rule:

If under 50 feet, go RG-8 (less $$)
If over 50 feet, go heliax or higher (more $$)

I use hardline for everything. Even my repeater jumpers are at least
1/4" superflex hardline. Makes a difference....
RG-8...good for HF, bad for UHF. Period. IMHO.

9767. New to GMRS - How should I program Kenwood TK-880

Yahoo group: GMRS (2005 — 2007)
Date: 2005-04-28 20:54:35 UTC
From: Chris Catotti
Topic: 9767 Message: 9767

Hello,

I am new to GMRS. I am KD4ACE (ham) and now WQCN791 (GMRS).

Our family has 6 blister pack Uniden handhelds, and I have a Kenwood TK-880 on the way. It is a 25 W, certified Part 95 type trunked radio. If I understand correctly, it has 250 available channels, and requires a Kenwood authorized tech to computer program it. It either has three programmable output power levels, or continuously programmable power levels.

I believe the tech has to program everything, frequencies, power levels, squelch tones,repeater frequency pairs, etc.

So my big question is:

What should I program into 250 memory channels?

I think I am allowed to program the shared GMRS/FRS frequencies at 5 watts output for mobile car use (short antenna feedline), and perhaps more for home user as a "small base station" where the feedline might be 100 ft (power loss per 100 ft at 450 MHz seems to be 3.9 dB/100 ft or greater).

Planning ahead to provide for possibly using this rig as a repeater would seem to be a good choice.

Although I am a General class ham, I do not have a lot of practical experience at RF and designing a system.

I live in the Orlando FL area (no mountains), have a homeowners association, and hiding antennas in flagpoles is not okay with my wife. Alternatives are trees or single story rooftop.

Radio brochures are viewable at:

http://www.handie-com.com/tk780-880%20Brochure.pdf

https://gullfoss2.fcc.gov/prod/oet/cf/eas/reports/ViewExhibitReport.cfm?mode=Exhibits&RequestTimeout=500&calledFromFrame=N&application_id=92748&fcc_id='ALH24593110'

Best Wishes,

Chris

The best thing to do is put in all gmrs channels at
higher out put and maybe the bottom 7 frs at 5 watts.
and if you had any rx only channels to add to the list

But ask for a button to be program for Talkaround and
on for scan, scan delet,
I use my kenwood for both gmrs and comerical use works
great. But if you have the button for talkaround it's
one less channel you will need. abd one more thing if
you need differmt tones put them in than becasue it
cost between 30 and 75.00 for the time of most twoway
shops.

The TK-880 is a decent radio. They have all kinds of features. Kenwood software is available from Kenwood, or if you search hard enough, you can find it. It tends to get a bit overwhelming for a first-timer, but again, there are people that can help you out and is quite easy once you learn your way around.

;)

I would suggest using the radio as a radio, and don't try making a repeater out of it. Much better things to do that with.

Program what you're going to use. Repeaters in the area? All GMRS channels, splinter freqs (5 watts, of course), etc? The radio is your oyster, crack it open.

Email me when you get it, theres alot of cool stuff you can do with it and I'd be happy to help you out.

I've had 3 of them, but now have 3 of the the TK-8180 series, the new version of the 880.

Still a nice rig, nonetheless.

From: Jay
Topic: 9772 Message: 9772

Hi..I'm Jay, N9WMU and now WQCJ910. Picked up a "Cougar" UHF mobile recently, comple and NIB, Hice small 25 watt trunking radio, from what the instruction booklet says. I have never even HEARD of these things..anybody have any info on them, and can they be programmed to work on GMRS frequencies? Looking to use it as a temporary base until new hings are acquired. Any info would be appreciated, and thanks to you all for a VERY informative group...I'm learning from it almost daily.

Cheers,

Jay

had a church that had some and you are right not that good.

Don't think they lasted them a year. Then they went to Maxon , them Motorola and now nextel yes back to junk. (when the system goes down and in some parts of there building no go.)

Blake:
I agree with you. The shop I worked in carried Ritron as one of our lines. Sometimes we had to repair the radio before we sent it out to the customer. The plastics were cheap and poorly fit. After a while, before the line was dropped, we would remove the little "Made in the USA" decal from the radio, out of respect for our flag, before we sent it out to a customer. What made them attractive to the radio shop was that they had a good price mark-up and they were a "throw away" radio. I believe the warranty was 90 days, with a list of exclusions of course (like turning it on:-)) Maybe they have improved a bit, but the Name Brand had burned a lot of bridges behind it.
Eric

From: Eric
Topic: 9777 Message: 9777

Hello:
Just a point to consider before you purchase that new repeater off the Internet.
Some manufactures restrict the areas that dealers can sell their equipment. You will notice this when you go to a dealer's web site and it says that they are limited to selling "Brand V" to a certain area. To get around this, some dealers advertise on the Internet that they are selling that brand of repeater, stating it was from a customer who canceled their order. Since it is theoretically not "ordered new for you" they can tell the manufacturer that it is used. An interesting point is that you can see that they just got it in their stock a few days ago and the UPS shipping label from the distributor on the West Coast is still on the box. A quick check on the UPS site of the tracking number shows that it was shipped to the dealer after the E-Bay ad.
How does this affect you? WARRANTY. These repeaters are sold "AS-IS". The Internet dealer does not perform warranty service. If you have trouble in the warranty period, "Brand V" manufacturer will tell you to contact the dealer you brought it from. Local dealers of "Brand V" will be hesitant to, or may not, service something you did not buy from them.
Before you buy off the Internet site, be sure that you get, IN WRITING, a commitment that the selling dealer will service the repeater while under warranty. Don't believe them when they tell you that "Any" authorized dealer will service it. If you get that statement, demand them to produce a letter guaranteeing it.
You may be surprised to find out that your local "Brand V" dealer will match or come very close to the Internet dealer price.
A lesson I learned from personal experience. -$
Cheers,
Eric

9778. Programmable radios bought used

From: kvsp1160@aol.com
Topic: 9778 Message: 9778

Just a late night thought... Why do some people buy radios used from eBay or another place, thinking that they can operate them on GMRS, and then find out that they can't program them or that they need programming? Don't the check the item out or do research on them BEFORE buying them? And then ask groups like us if they can be programmed and what the specs are on them...

I'm not complaining, as I do very much enjoy helping others with this system, as well as giving out free advice and info. But it strikes me in a funny way on why they buy and then ask, versus ask then buy... (this has no connection with the cougar item posted earlier)

Just a thought. No need to reply or comment, unless you really want to...

Good point ... Ebay is a dumping ground for two way
radio stuff good,bad and broke. You get what you pay
for .. Also dosen't help when you have to buy a
battery that is worth more than the radio.

This chap has been in hot water with the FCC and the police for quite a few years - mostly over his interfering with Police radio comms and repeatedly & willfully violating FCC regs.

It started, I believe with him calling in a real emergency (someone seriously hurt) from a parking garage using a Police Dept frequency. After the dust settled, the PD was irate. He might have been OK, but... the FCC eventually determined that there was an operating payphone in plain sight not more than a few steps away -- one on which calling 911 requires no coins. So, according to the FCC, he lost his 'privilege' of using "any means necessary to summon help" due to caveat in the regs that assumes there is no other method of communication.

it went on to him interfering with ship comms and basically making a nuisance of himself on a few California repeaters and on the airwaves in general. I'm not sure if he operated outside his freq privileges, but by that time his ticket was revoked.

His on-the air antics were (still are?) legendary in California.

After his ham ticket was revoked, the FCC also revoked his recently issued GMRS license - makes sense in that of he can't play by the rules on the Amateur Service then there's no sense in letting on the air in any service.

He had some previous jail (and/or prison ?) time for violating (VERY egregiously) FCC regs including operating without a license. Seems he feels that the FCC had no right to revoke his licenses and he goes ahead and operates anyway. I've seen quite a few of his vulgar emails on a few reflectors over the years - but some of those postings might just be copy-cats piling on and impersonating him.

The next time he's released, he'll likely have a court imposed sanction that he never operate a radio transmitting device other than a cell phone.

Folks in California who've heard him assume he's not playing with a full set of tuners in his noggin.

Do a google search on his name and/or call sign .. should find some previous news.
There have also been a number of items on the ARRL site - under radio news.

I see his call is now listed as a vanity call and it belongs to a radio club. LOL!

Subject: Re: [GMRS] Breaking News!!! X-KG6IRO Jammer Jack Gerritsen Arrested!!!!!

This chap has been in hot water with the FCC and the police for quite a few years - mostly over his interfering with Police radio comms and repeatedly & willfully violating FCC regs.

It started, I believe with him calling in a real emergency (someone seriously hurt) from a parking garage using a Police Dept frequency. After the dust settled, the PD was irate. He might have been OK, but... the FCC eventually determined that there was an operating payphone in plain sight not more than a few steps away -- one on which calling 911 requires no coins. So, according to the FCC, he lost his 'privilege' of using "any means necessary to summon help" due to caveat in the regs that assumes there is no other method of communication.

it went on to him interfering with ship comms and basically making a nuisance of himself on a few California repeaters and on the airwaves in general. I'm not sure if he operated outside his freq privileges, but by that time his ticket was revoked.

His on-the air antics were (still are?) legendary in California.

After his ham ticket was revoked, the FCC also revoked his recently issued GMRS license - makes sense in that of he can't play by the rules on the Amateur Service then there's no sense in letting on the air in any service.

He had some previous jail (and/or prison ?) time for violating (VERY egregiously) FCC regs including operating without a license. Seems he feels that the FCC had no right to revoke his licenses and he goes ahead and operates anyway. I've seen quite a few of his vulgar emails on a few reflectors over the years - but some of those postings might just be copy-cats piling on and impersonating him.

The next time he's released, he'll likely have a court imposed sanction that he never operate a radio transmitting device other than a cell phone.

Folks in California who've heard him assume he's not playing with a full set of tuners in his noggin.

Do a google search on his name and/or call sign .. should find some previous news.
There have also been a number of items on the ARRL site - under radio news.

he is out on bail now.... I linked into the winsystem
and found out he bailed out... he was violating a restraining order from the
147,435 repeater in calif.

gee maybe all the owners should get restraining orders??
at least he will run out of bail money!!

9790. Suggestions on Mobile GMRS radios ?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-05-05 21:20:00 UTC
From: Chris Catotti
Topic: 9790 Message: 9790

Does anyone have any experience at using a trunked radio,
such as a Kenwood TK-880 or others, on GMRS?

The radios seem to have 250 programmable channels.

Has anyone developed a "favorite" layout for frequencies, and PL Tones?

Most of the buttons are also programmable in function. Any suggestions?

Let me summarize my understanding:

FRS has 16 interstitial channels. Eight of those are usable by GMRS at 5 Watts
Effective radiated Power (ERP) maximum.

The other eight are limited to 500 milliwatts on FRS Part 95B certified gear, so the
most I can do there (other than blister pack hybrids) is have the eight FRS-only
channels programmed as "receive only".

That leaves eight more GMRS receive channels that can be used in simplex, where
I transmit on the receive frequency (462.XYZ MHz), and Duplex operation where
I transmit on the repeater input frequency (467.XYZ MHz) and receive on the
repeater output frequency (462.XYZ MHz).

The repeater pairs 462.XYZ/467.XYZ all can have various squelch tones to activate
repeaters. These squelch tones appear to be required to be programmed initially,
as I have not seen a mobile radio (25-50 watts) that lets the user change the
squelch tones from just using the front panel of the radio.

Lastly, the 5 Watt GMRS channels 462.5625, 462.5875, 462.6125, 462.6375,
462.6625, 462.6875, 462.7125 MHz are specified at 5 Watts ERP. So if I had
plans to run the RF Output of the radio through any significant length of coaxial
cable, I could run more than 5 Watts output, because the cable has significant
losses. I would just have to be careful to match power to cable run, and never
get mixed up about power levels while using the radio in the car, where cable
runs are relatively short.

I have obtained permission from a county government/REACT/RACES repeater
operator to use there repeater on a noninterference basis. I am eager to get
a radio and try it out.

Does anyone have any experiences to share?

Thanks!

Chris Catotti

Federal Agents Arrest, Detain Alleged California Jammer
NEWINGTON, CT, May 5, 2005--Reputed Los Angeles-area repeater jammer and former Amateur Radio licensee Jack Gerritsen is behind bars and off the air today. Acting on a May 4 criminal complaint, FBI special agents, accompanied by personnel from the FCC Los Angeles Field Office, arrested Gerritsen without incident early May 5 at his home in Bell, California. Federal agents also are reported to have confiscated Gerritsen's radio equipment.

"A criminal complaint filed Wednesday afternoon charges Gerritsen with a felony charge of malicious interference with a communications system operated by the United States and a misdemeanor count of transmitting radio signals without a license," said a statement from the office of Debra W. Yang, US Attorney for the Central District of California. "The two charges carry a potential penalty of 11 years in federal prison." A criminal complaint contains allegations that a defendant has committed a crime.

The 68-year-old Gerritsen was turned over to federal marshals for booking at the Metropolitan Detention Center, the federal jail in Los Angeles. He was scheduled for an initial appearance May 5 in US District Court in Los Angeles.

According to the criminal complaint, an FCC investigation revealed that Gerritsen "often transmits his prerecorded political messages and real-time harassment and profanity for hours at a time, often making it impossible for licensed radio operators to use the public frequencies."

Gerritsen already faces a total of $52,000 in FCC-imposed or proposed forfeitures for alleged interference. In March, the FCC denied a Petition for Reconsideration and upheld a $10,000 fine against Gerritsen for interfering with Amateur Radio communications. The Commission affirmed the fine in a Forfeiture Order last October. Gerritsen, who claims he's still a Commission licensee and uses KG6IRO on the air, had written the FCC to challenge the fine and its basis. The FCC turned away all of his arguments, but Gerritsen has yet to pay the fine.

An FBI affidavit sworn out this week in advance of obtaining a search warrant of Gerritsen's residence indicates that FCC agents have been investigating multiple instances of unlawful radio transmissions and malicious interference attributed to Gerritsen over the past four years. FCC agents on a regular basis have been monitoring radio transmissions said to be coming from Gerritsen. They've also spoken with him in person and asked to inspect his station, although earlier FCC documents say he refused that request.

In addition to Amateur Radio repeater communications, Gerritsen is alleged to have interfered with Military Affiliate Radio System (MARS) transmissions. The FCC also reported that it has received complaints from other government agencies that Gerritsen interfered with local and state police and fire agencies, the American Red Cross, the US

Coast Guard Auxiliary and other radio services. A MARS training exercise in March had to be canceled as a result of interference attributed to Gerritsen.

Earlier this week, Gerritsen, who briefly held the call sign KG6IRO as a Technician licensee, was taken into custody by Bell, California, police officers on an unrelated contempt of court citation after violating the terms of a temporary restraining order (TRO) a local radio amateur had obtained to keep Gerritsen off a local repeater. He was released without bond after being held for a few hours and was reported back on area repeaters not long afterward.

Radio amateurs on the West Coast have been complaining for months about the slow pace of enforcement action in the Gerritsen case. Los Angeles-area repeater owners have taken to shutting down their machines to avoid the nearly constant barrage of malicious interference attributed to Gerritsen.

Five years ago, Gerritsen was convicted of interfering with police radio transmissions. He was convicted in state court and sentenced to 38 months in prison. Following his release in July 2003, the FCC soon began receiving complaints about Gerritsen's activity on the airwaves, according to this week's criminal complaint.

Yang's office said the FBI "received substantial assistance" from the FCC in the case.

Please don't take this as a flame as it is not intended as such. However, I'm sure this isn't within the "spirit" of the regulations for GMRS, as such being for "short range communications". While I can see the usefulness of a "moderate" network on more of a local basis, I must say that what you propose could present major interference problems not to mention the "monitor before you transmit" concept. I think your efforts could be better served doing this (as it has been done before) using amateur radio where "official" coordination and experimentation allowance are in place.

Just my thoughts

How does this present major interference, and what
prevents them from monitoring?

Haveing the reciever on Carrier squelch will monitor,
or using BCLO would work as well.

While I agree, it does tend to conflict with the "spirit" of the
law, perhaps the law should have been better written?

9798. "Home" repeater help

Yahoo group: GMRS (2005 — 2007)
Date: 2005-05-12 00:29:31 UTC
From: Chris Catotti
Topic: 9798 Message: 9798

Can anyone offer suggestions on how to set up the following at minimal expense:

I would like to set up a duplex repeater at home. The primary purpose of the repeater is to keep in touch with family members at home. The family member(s) would be using a Kenwood TK-3131 (0.5 or 1.0 watt), with squelch tone and talking through the home repeater (25 or 40 watts) TX/RX pair of frequencies. They would be trying to reach either a car with a mobile 25 or 40 watt mobile unit, or another family member carrying a TK-3131. The away-from-home person might hera the call on a TK-3131, but would try to hit the home repeater using the full-power mobile radio (in the car).

As a less desirable solution, are the simplex-store-and-record repeaters permitted for use on GMRS base stations? An example would be an MFJ 662 MFJ SIMPLEX POCKET REPEATER.

http://www.wb0w.com/mfj/antennas/mfj662.html

The Kenwood TK-3131 with a repeater at home would allow my wife to act as if it was not that different than a cordless phone, in terms of ease of use and convenience.

Also, I do have a homeowners association. We are the first house on the block. There are trees in our yard that could be used. Our rooftop is approximately 16 feet above ground. We are in the Orlando FL area -- part of the lightning capital of the world.

Thanks!

Chris Catotti.

9799. RE: [GMRS] "Home" repeater help

Yahoo group: GMRS (2005 — 2007)
Date: 2005-05-12 03:36:29 UTC
From: Mathew Quaife
Topic: 9798 Message: 9799

First off, to get any real distance at that frequency, height would be a major factor. At 90' with a high gain antenna, best I can get mobile to the repeater with a 10 watt repeater is about 25 miles, and then I have to bend the rules a bit and use 25 watts, at 5 watts I can make it about 15 to 20 miles with a bit of noise on the signal. There are several repeaters on the market, and if you do not have any knowledge in building them, and do not have the necessary equipment to maintain them, it would be better to buy something out of the box, plug and play. As for the simplex repeater operation, I'm not sure about legals, but very crude, they do work, however, takes twice as long to get a conversation about, and generally audio is not that quality on them. Good luck in your endeavor's.

Mathew

Subject: [GMRS] "Home" repeater help

Can anyone offer suggestions on how to set up the following at minimal expense:

I would like to set up a duplex repeater at home. The primary purpose of the repeater is to keep in touch with family members at home. The family member(s) would be using a Kenwood TK-3131 (0.5 or 1.0 watt), with squelch tone and talking through the home repeater (25 or 40 watts) TX/RX pair of frequencies. They would be trying to reach either a car with a mobile 25 or 40 watt mobile unit, or another family member carrying a TK-3131. The away-from-home person might hera the call on a TK-3131, but would try to hit the home repeater using the full-power mobile radio (in the car).

As a less desirable solution, are the simplex-store-and-record repeaters permitted for use on GMRS base stations? An example would be an MFJ 662 MFJ SIMPLEX POCKET REPEATER.

http://www.wb0w.com/mfj/antennas/mfj662.html

The Kenwood TK-3131 with a repeater at home would allow my wife to act as if it was not that different than a cordless phone, in terms of ease of use and convenience.

Also, I do have a homeowners association. We are the first house on the block. There are trees in our yard that could be used. Our rooftop is approximately 16 feet above ground. We are in the Orlando FL area -- part of the lightning capital of the world.

Thanks!

Chris Catotti.

Another thing....co-channel, close proximity repeaters that aren't
part of the "link" system. You don't think an issue would occur?

I would like the people who doubt its usefulness or that think it
will be out of control to look at this site
http://www.446user.co.uk/download.html and perhaps join with the
client program this is the british version of gmrs they call it pmrs
and they are doing it there and as of yet it has not gone out of
control as a corridnator of the server i can mute stations that cause
problems based by name ip address etc so they can not cause problems
within the network
Thanks for your time
Fred

Greetings Chris

You really should check out the repeater builder website and/or yahoo group. There is a wealth of info there from folks that are extremely knowledgable. There are so many factors that come into play in setting up a repeater, it's difficult in this forum to go into them all. I might suggest a local amateur mentor with repeater experience to guide you.

Good luck in your endeavor

go with a ham radio tower as the home owner association can not touch it.
there was a city in our area that tried and I guess there is a federal law
that lets you do it.

9804. GMRS repeaters to buy

Yahoo group: GMRS (2005 — 2007)
Date: 2005-05-12 16:51:52 UTC
From: Kamy
Topic: 9804 Message: 9804

What are good GMRS repeaters/Basestation that can be purchased for under $2000. Does the icom IC-FR4000 or FR3000 classify as a GMRS repeater. Please advice this is for Work project releated purchase to test Public safety communication in our labs

Kam

You said the magic word....coordinator! GMRS has no official coordinating body like amateur radio does. I am not familiar with the rules of pmrs therefore I don't know if any "official" coordination is required before a repeater can be placed in service. And yes I know that US coordinators have no enforcement or binding powers in and of themselves, however, the FCC sure does follow their recommendations if it goes before them.

GMRS is for families. I am also a Ham, and enjoy the benefits of other technologies because of it. We would be best to use our GMRS for the purpose it was intended for.

It's not that hard to get a Ham license. You can have both!

Sure it could. The EXACT SAME that a
non linked repeater would cause. The link
system would in no way add to the interference.

Blake

How do you know what is going on in "Tim-buck-too" where the
distant "link" repeater is located while transmiting from So Cal for
instance?

A person is gonna be able to monitor a conversation going on in
simplex mode from across the nation?...Not

around here the GOV got that if it is for ham use they give you the permit
without to much problems. just have to show it is approved by and engineer
and the FAA as not in a flight path.

9813. Re: [GMRS] "Home" repeater help

Yahoo group: GMRS (2005 — 2007)
Date: 2005-05-11 20:14:52 UTC
From: A10382
Topic: 9798 Message: 9813

A few states have enacted their own versions of PRB-1 - usually called an Antenna Bill. How they affect CC&Rs, deed restrictions, condo/coop/home owner assoc rules, etc. vary from state to state. I believe the ARRL has these posted somewhere on their web site.

The federal PRB-1 merely requires states and localities to 'reasonably accommodate' Amateur Service radio antennas. The word 'reasonable' is open to a lot of interpretation - typical of much of the FCC regs and many laws in general. This 'interpretation' is what gives a lot of laws unintended consequences and creates full employment for attorneys.

The PRB-1 reg was aimed at amateur service and also to keep the cable-TV industry from locking out satellite as well as broadcast TV. A few years ago, the local cable company offer to pay me $100 per acre to add an anti-antenna covenant to our deed - despite the fact that there is no antenna zoning regs in the county for parcels greater than 25 acres. Their game was to lock in the restriction if my property every got sold for subdivision. I turned them down and just 6 months later the local owners of the cable system sold out to Cabelvision. I understand this was a fairly common occurrence at the time in order for local owners to boost their company's value before acquisition.

One large problem with GMRS is that the local building/planning & zoning folks will frequently classify GMRS as a commercial radio service. Most of the guide books for zoning folks still have the pre-1985's classifications of this service when it was primarily a commercial one. Even 27mhz CB, which is limited by FCC regs in the US to 155mile contacts, is considered a short range service and antenna heights are frequently limited to those for residential TV antennas.

If you are going to fight, start with an amateur radio antenna. Get you FCC tech ticket if you don't already have one - the 35 question multiple choice test is fairly easy to study for and does not require Morse code proficiency.

In addition to this, there is frequently a gauntlet of county and city/town zoning and building permit hurdles to navigate. In some areas, in an attempt to circumvent PRB-1 and state/local requirements, the local Planning & Zoning officials will put you through some expensive legal hoops in trying to dissuade. All they have to do is keep postponing, adjourning, and asking for more info and your attorney's cash register keeps-on-a-ringin'. They are sometimes hoping you run out of money as they 'paper you to death'.

I fought a battle or four in different locales and won 4 out of 5 (in the 5th case I was transferred before the battle came to fruition.

For amateurs, the ARRL is a great resource and can usually provide local help.

Another thought is to erect a wire antenna between trees. A 'dipole' for GMRS will be short - actually VERY short and easy to hide between trees. Even a 1/2wl wire vertical can be hoisted up a tree, operate well, and be very easy to conceal. No tower = no construction permit.

A yagi can be hidden in a classic TV antenna. A vertical can be added atop a TV antenna mast. There are so many ways to get creative. If you have a clear view of the surrounding area from your roof top, a 'ventenna' type antenna is absolutely invisible (it merely slips over the vent pipe on your roof and can cover a surpassingly large area on 50W or less.

I'd say shoot onto eBay for your needs. They got some cheap repeaters for simplex and duplex uses, as well as some great mobiles and HT's.

As for the antenna, trees are good, but they have to clear the branches and if you're in a lightning area, then buy yourself a lightning arrestor or grounding system of some kind.

Also, hamradio.com has an antenna called the Ventenna. It's an antenna that looks like a vent and mounts to your existing vent on your roof. Not sure how well they work, but might help with "hiding" your antenna.

If you live in an antenna restricted area (CC&Rs), PRB-1 does not apply. In almost every instance the courts have upheld CC&Rs as contracts between homeowners and the association that were entered into freely when the home was purchased.

There is a lot of truth in this. I currently am battling with my local building inspector just "trying" to get a building permit. Zoning stuff is ok and I'm approved and have the paperwork, but the silly (trying to be decent here) inspector told me that my brand new, commercial tower must meet 3 times the max wind speed for the area. I'm in a 70 mph area so, according to him, my tower must withstand winds of 210MPH!!!!!! This is ludicrous (sp). So now, I have to get a wet stamp from an engineer...adding, In don't know how much $$$$$ to my project.

Politics...don't ya just love it!

Subject: [radios4sale] Maxtrac 32 channel radio and other items for sale.

1 each Motorola Maxtrac UHF 440 - 470mhz 32
channel 25 watt mobile model # D34MJA7JA5AK
16 pin accessory port with mobile mounting
bracket, mini Motorola palm mic model #HMN-1056D,
mini UHF to SO-239 adapter and a power cable.
This unit is a 9 out of 10, 10 being new in the
box.

Sale price $115.00 plus $15.00 fixed shipping
cost UPS ground to the lower 48 States.

---
1 each Motorola UHF 450 - 470 50 watt mobile PA
model # N1275A, includes short power
cable. This unit with go down to the 440 range if
desired.

Sale price $50.00 plus $10.00 fixed shipping cost
using UPS ground to the lower 48 States.

---

1 each Kenwood TK-3100 UHF 2 channel handheld.
Radio only with belt clip, no battery,
no antenna and no charger. This radio does work
and is not DOA.

Sale price $10.00 plus $10.00 fixed shipping cost
using UPS ground to the lower 48 States.

---

1 each UHF 450 - 470 Mobile duplexer, with 2 each
SO-239 connectors and 1 each BNC female
connector similiar to the Cellwave model #
633-6A-2.

Sale price $50.00 with a fixed shipping cost of
$12.00 using UPS ground to the lower 48 States.

Pictures available upon request.

If interested in any or all items listed please
contact myself directly at "n6cid@..."

Well having listened to alot of arguments on this i have realized people like this idea but only for localized linking which can be done easy enough it could be done by state by county all the way down to town the links could be connected and disconnected at will via dtmf codes i see now you are right that a national link up would be chaotic as far as hobby chatting some people do that on gmrs its not as formal as ham radio i am a ham operator but im not that into talking on ham bands and i agree that this network is probably not for the repeaters that have alot of hey could you pick up milk honey because every husband in 1000 miles will be going to the deli but it can be done as i said and it would need volunteers if done this way to moderate the small networks in case one repeater gets some idiot keying up and doing noises or whatever it is jammers do a admin could mute that link or disconnect it from the network if you think it would be a good idea handled like this i will need as much support as possible to get this to pass through and as much support as possible to get the network together and organized in a clean manner

Thanks

It also may be forbidden for use on GMRS. I wrote the
FCC in detail, asking all the conmmissioners as well
as the general info address to make a ruling.
Typically, they take only a couple days. I addressed
the eQSO issue, DingoTel, and VOIP in general. This
is one of the forums in which I will post any replies.

John,

I emailed the FCC about Dingotel about six months ago. They replied that they were looking into it.

It's now on sale just about everywhere, including Amazon and MSN.

I would guess, based on its wide availability, that it is here to stay.

If necessary, the FCC may rewrite the rules to make it acceptable. They always seem to defer to big business.

Get used to it, Roger. The mass market public will win out over the
"radio-savvy" minority every time.

>Hopefully, the FCC will fall towards our side and stop this "junk" for now.

"Our side" has fewer votes than "their side." They will win over the long
term. The FCC listens to Congress and congress knows where the votes are.

Best strategy -- get your ham license and help the ARRL and others protect
the amateur frequencies from the commercial interests (such as BPL) for as
long as possible.

The world becomes more spectrum hungry every day. Just like land, water
and oil. There isn't enough to go around.

Good luck,

That is something we are trying to aviod. There is a much better picture than a simple device such as this. We want to stop the FCC from changing all the rules to let any gadget and toy through. I hope in the end we get enough folks on our side to get the interests of the service to be the first concern of the FCC... instead of commercial interests.

What is your problem? Are you someone who prefers to operate GMRS without a license? Do you support illegal operation and the criminals who operate illegally? HUH?

There are much bigger issues under the surface than this simple DingoTel device. These are being addressed too. You just don't see the big picture.

Yes. It allows a person to connect their radio to other radios via an internet connection. You can create a network of interconnected radio systems. While useful in some situations, it can also be a disaster.

9836. The DINGO

Yahoo group: GMRS (2005 — 2007)

>is this radio repeater capable or something?
>if so we are in a world of hurts!!

No... Dingo is not designed to be duplex-repeater capable.

Don't overreact. Dingo is designed for 2-3watt radios simplex only. A few miles at best.

If you really need a long distance repeater, get a technican's license and operate on 2 meters or 70cm. You'll get worldwide repeater capability allowing you to talk as far as Europe and Australia via amateur repeaters and VoIP.

The FCC is slowly evolving GMRS into a family-oriented medium-range service of 30 to 100 miles.

Good luck,

From: wqcu526
Topic: 5099 Message: 9837

I recently purchased a set of GMRS/FRS radios (yes, a bubble pack) for family use. I wanted to be legal so I obtained a FCC license. Now that I have the radios and a license, I am looking for other ways to use my investment. If there was the potential to use my radios more often, I would purchase a more expensive unit. I guess I am asking how others are utilizing their GMRS radios.

9838. Re: New to GMRS

Well you can use them in many ways, such as when traveling in more than one vehicle with family you can give one radio to each vehicle with a family member in it. When you got to the park with family or kids, you can have each person carry a radio to stay in touch.

Sometimes when my wife goes into the shopping mall I giver her a radio to keep in touch because she liked to go different plaes than I do, our cell phones don't always have good signals indoors.

Amusement parks, Festivals, etc. I was recently at a family reunion in Denver and used my GMRS radios plus a few extra at the event. I was able to communicate with family members all over the area as people traveled and shopped, visted, by the pool, etc.

I have even used them as a quick intercom between the upstairs and downstairs of our house.

Best way to use them. Holloween, place a radio outside in a scarecrow and turn the volume all the way up and when kids approach --- <hehe> the scare crow starts talking.

I use mine for long distance communications by repeaters, for community service, and one of my HT's has a DTMF (Dual Tone Multi Freq.) pad on it for use with my repeater controller.

There are other uses that others have for their rigs and systems. But most use them on repeater systems and also to help their community with emergency issues and groups/organizations, etc.

ERP == Effective Radiated Power.

This is power with the antenna gain (and feedline loss) taken into account.
Eg, 20W transmitter output into a 3db gain antenna gives you an ERP of 40W.

PEP == Peak Envelope Power

This is the maximum power transmitted on modulation peaks of a SSB (single
sideband) or similar modulation mode. It's not relevant for GMRS.

These two terms are not mutually exclusive.

-Ben

9843. RE: [GMRS] ERP vs PEP

Yahoo group: GMRS (2005 — 2007)
Date: 2005-06-03 14:51:17 UTC
From: Mathew Quaife
Topic: 9841 Message: 9843

ERP is the power of the transmitter that makes it to the antenna, time the gain of the antenna for the total erp. FM is usually measured in erp. PEP is called peak envelope power, is generally referred to an transmitter class of SSB or AM, and is the maximum power that it will perform. Example my Kenwood TL-999A amplifier is rated at 1500 watts pep, but when I talk into the microphone it generally only shows about 700 watts output, if I whistle into the microphone, it will then peak up to the 1500 watts on the power scale. Hope this helps.

To answer your question, my two meter repeater has a maximum output of 125 watts, with a total ERP of 375 Watts, so the gain of my antenna times the power of my transmitter cannot exceed 375 watts total erp. In the GMRS service, one that would take a 50 watt transmitter with a 6 db gain antenna would have exceeded the power limits for the GMRS service, since we are limited to 50 watts erp.

Matthew

Another term you'll see often is TPO. Transmitter Power Output. This is what comes out the port on the back of the radio. From this you add and subtract the gains of the antenna and the losses of the duplexer and coax lines. What you end up with is your ERP.

I use this calculator to go through the math:

http://florida-repeaters.org/rptrcalc.htm

You'll quickly see that a good antenna can make a big difference. Even more so when you consider that GMRS is limited to a 50 Watt TPO.

Almost. If the loss in the cable and duplexer is equal to 6 db,
then the 50 watt transmitter into a 6 db antenna, would be
legal.

IE, if a 25 watt transmitter has 3 db loss in the duplexer and
hardline, and 6 db gain in the antenna, it would be legal, as
the ERP would be 50 watts ERP.

If a 100 watt transmitter has 3 DB loss in the duplexer and
hardline, and a unity gain antenna, it would only have 50 watts
ERP.

I did not want to confuse him with the coax loss at this point, as it would change with length, and would need to be calculated once he began the installation. And I would also hope that no one would consider using a feedline with that much loss at 460 Mhz, but indeed that would make it legal.

9848. eQSO GMRS Linking gone?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-06-04 16:22:53 UTC
From: Scott Ziegler
Topic: 9848 Message: 9848

Well it looks like the eQSO GMRS linking site discussed here in the past is gone.
It was relayed that the site was down for maint as week or so ago and now when you try to go to that site you get a redirect to and English as in UK web hosting site.

Hummm, wondering whats up.

Scott Ziegler

>

Tom's correct. Part 95.135 (a) states "No station may transmit with more than 50 watts output power." (b) reserved. (c) "A small control station at a point north of Line A or east of Line C must transmit with no more than 5 watts ERP." (d) "A fixed station must transmit with no more than 15 watts output power." (e) "A small base station must transmit with no more than 5 watts ERP."

Output power is measured at the RF out connector on the power amp (before the duplexer!) if it is a repeater or obviously, the antenna connector on a mobile/base/handheld.

GMRS regulations mandate the maximum power output for *any and all*
GMRS stations is 50 watts.

GMRS is 50 watts TPO!!

That is at the antenna port. From there on you are only limited to Algebra!

A quick search of part 95 will explain this.

Whoa, just a minute... I'm just catching up with this thread, but are
you guys under the impression that there is a 50 Watt ERP limit on
repeaters in GMRS?

Date: 2005-06-10 05:03:20 UTC
From: BILL
Topic: 9853 Message: 9853

Hello Everybody,

I'm fairly new to GMRS and was wondering if there were any other users in or around the Chesapeake VA area.

On a side note: what type of radios do most people use? I was given a couple of hand-held radios (Cobra PR4700WX) -- are these any good or should I invest in something else?

Thanks in advance.

Bill

9855. Help with programming SM4450 Maxon

Yahoo group: GMRS (2005 — 2007)
Date: 2005-06-12 22:53:44 UTC
From: w0vne
Topic: 9855 Message: 9855

Hi all. I decided to set up a GMRS system for my family to use and bought a Maxon SM4450 from Ebay. It was set up for LMRS (I think) and I am looking for a way to reprogram it for GMRS. BTW I picked up some very inexpensive 2 watt GMRS hand held units from the local Radio Shaft and am amazed. They work pretty good! None of the bubble pack radios that I see appear to be able to do repeaters however. Is this the standard?

Anyhow I'm handy with soldering irons if you have a schematic for a cable that would be great. If you have a program and cable you want to unload that will work? Also great. Thanks.

well just checked the 4450 is a 16 channel unit 40 watts 460 to 470. was in the 2002 price book
then in the new price book 2005 now also midland radio it does not show.
in the 2002 book there is a program cable and software (dos) the set list about 150.00

I don't have a copy as I never sold any. If you need any more info let me know John

9857. Re: [GMRS] Help with programming SM4450 Maxon

Yahoo group: GMRS (2005 — 2007)
Date: 2005-06-13 11:33:36 UTC
From: kvsp1160@aol.com
Topic: 9855 Message: 9857

Hi,

Glad to hear that you found some good units for your family. Normally, bubble-packs don't include repeater frequencies (467.xxx). And usually we prefer that, as we hear and find that many families don't pay for their GMRS license. I hope that you have yours... =c)

I use Pryme radios for my access to repeaters, and others on here use Icom, Kenwood, Motorola, Midland, and others as well. Some do use bubble-packs with repeater capabilites which is fine, as long as they're happy and it works well for them.

There are many different applications that folks use with their radios. Whether it's with a fire or emergency service, community service, or for personal/family use, the GMRS system can provide means to everyone! Just as long as they have a license.

Hope to hear you on the air soon, or whenever... 73's!

9858. Repeater Capable Handi-talkie with removable antenna ?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-06-16 14:01:03 UTC
From: Chris Catotti
Topic: 9858 Message: 9858

Can anyone provide any recommendations for GMRS handitalkies with the following features:

1. Changeable antenna (BNC, TNC, etc.)

2. Squelch tones (user selectable, unless already programmed with different tones for same RF frequencies)

3. Can be powered directly by plugging into 13.8 Volts (automobile power cord)

4. Capable of repeater (split frequency) operation

5. Rechargeable battery Pack

6. Alkaline Battery Pack

7. Selectable power levels - even on alkaline batteries

8. Easy to use

Second Question

Any recommendations for a GMRS RF Power Amplifier that can connect to a handitalkie antenna connector

You have a lot of potential for your contacts... =c)

There are many radios on the market today that are NOT bubble packs. Many manufacturers like Icom, Kenwood, Pryme (discontinued), Motorola, and others (GE, etc.) are great for what you need. Some have up to 16 channels to program, while others have as much as 99 different channels! It all depends on what frequencies you need and what tones you're going to use. Icom, Pryme, Motorola, and the "others" have what's called a DTMF or Dual-Tone-Multi-Frequency keypad that allows you to change the channels or tones yourself, to program the radio, and to access repeater systems when the time comes. All have removable NiCad and Alkaline batteries, wall charger ports, and interchangeable antennas (removable).

Now there's also the cost to think about. Some are $80, while others tend to raise it up to around $200 or more. This also depends upon whether you're getting a HT (hand-talkie), or a mobile radio (or even a base if you can find one). And then there's a charge for programming either by the manufacturer or from a local radio shop.

But when you find that perfect radio, you'll enjoy the best of what GMRS has to offer.

Several of the Kenwood TK series radios fit most your needs... I have used the TK-340 with very good results. On your second question... I have used a Motorola N1275A with the Kenwood and a bnc/uhf adapter... it puts out about 35 watts or so with the radio on high power setting.

9870. MAXON 4450 Status Report

Yahoo group: GMRS (2005 — 2007)
Date: 2005-06-19 23:39:50 UTC
From: w0vne
Topic: 9870 Message: 9870

Well, I ended up buying the software and manual from an internet company. I found the schematic for the cable on the MAXON Software site. Go figure! Anyhow I wired up a little card and discovered that you don't need a power supply. This is good! The Maxon has it's own hefty 5 volt supply. After I got the "rite" comm port selected on my old laptop I was reading the radio! Hoo Hoo! I entered in some GMRS channels and selected the 141.3 tone for the "National" repeater on 462.675 MHz. I also plugged in the FRS Channel 7 Tone 3 which I was told was the "Ham" official meeting place for simplex. I made priority scan the National Repeater but... It doesn't seem to hear anything when I push the scan button. It lights up but transmitting on the that output does zip.

Also (*And YES I'm sure this is operator error) I put tone on both transmit and receive for all channels. Yet when I transmit without any tone I come in fine! If I select tone I get the "CALL" button lamp on. What do I have to do to tell this thing not to play any sound unless the other guy has the correct tone???

I note that the higher the tone the quicker the CALL lite comes on. Perhapes a good reason to keep using higher freq tones so you don't miss the first half of a word????

Next I've got to set up (and make) either a groundplane or JPole antenna. Anyone know off hand the dimensions?

Thanks for your help

Nope, not here. Nor cal gets pretty quiet most of these days. Not much activity, and it they're on simplex, it's not a threat for us. They hear us, but we ignore them and "can't hear them". pretty simple.

So I guess I'm not worried, unless some guy off of CB tries that on GMRS. Then maybe a little ruffled feathers here and there...

Topic: 9870 Message: 9873

since that is a 40 watt radio you need to drop the power on the FRS channels
also not sure if the radio will do narrow band (12.5)

you need to check as 40 watts and 25K are not correct for FRS channels.

Well...

First, the national simplex for ham is not FRS, but rather 20 MHz down (442.500).

Second, it's easy to either make your own ground plane antenna, or go to Rat Shack and buy their discone antenna which works great for simplex comms. Once you have the discone antenna, move the adjustable part of the antenna (the vertical radial) (too late to think of the correct name) up about 1/8" which should correct any SWR problems, and allow the antenna to TX/RX on 462 (originally tuned to 440 and others).

If you make your own, and you have access to a local ham shop, ARRL has the dimensions in their antenna book, but redo the calculations that they give you from 440 to 464 (which is between 462 and 467). I'd give em to you now, but loaned the book to a friend. =c)

There is no "national repeater". .675 was the unofficial calling and
traveler assistance frequency in the old days.

>I also plugged in the FRS
> Channel 7 Tone 3 which I was told was the "Ham" official meeting
> place for simplex.

No. Why would amateur radio operators use a frequency that is not
allocated to their service as a simples meeting channel?

>I made priority scan the National Repeater
> but... It doesn't seem to hear anything when I push the scan
> button. It lights up but transmitting on the that output does zip.

Since there is no repeater there, that would make sense.

Hi Ben,

Below is a posting I wrote last week. Even though it's not the same as everyone elses responses, it'll help you with your search. And I'll also include some websites to check out as well.

--->
There are many radios on the market today that are NOT bubble packs. Many manufacturers like Icom, Kenwood, Pryme (discontinued), Motorola, and others (GE, etc.) are great for what you need. Some have up to 16 channels to program, while others have as much as 99 different channels! It all depends on what frequencies you need and what tones you're going to use. Icom, Pryme, Motorola, and the "others" have what's called a DTMF or Dual-Tone-Multi-Frequency keypad that allows you to change the channels or tones yourself, to program the radio, and to access repeater systems when the time comes. All have removable NiCad and Alkaline batteries, wall charger ports, and interchangeable antennas (removable).

Now there's also the cost to think about. Some are $80, while others tend to raise it up to around $200 or more. This also depends upon whether you're getting a HT (hand-talkie), or a mobile radio (or even a base if you can find one). And then there's a charge for programming either by the manufacturer or from a local radio shop.

But when you find that perfect radio, you'll enjoy the best of what GMRS has to offer.

--->
As for the websites:

www.kenwood.net
www.icomamerica.com
www.motorola.com
www.rkleef.com
www.hamradio.com
www.ebay.com
www.eham.net

That's all I have at the moment. Got plenty more on my other computer in my office. (if I'm missing anything else, guys, let Ben know) Enjoy!

Topic: 9870 Message: 9881

The maxon is slow to decode more so when you use the DSC codes, if it presents a problem and you get a bunch of clipping leave the tone off on the RX side and it will work the. you may get a lot of noise from intermod or white noise from time to time but it still has the adjustable squelch so crnak it up a little more.

Do a search for the gnrs freq in your area and scann the repeater outputs for a while without a RX code you might find a group like I did. most groups are receptive to users that are licesed.

You have a good basic inexpesive radio , witch is exactley what I started with. I have graduated to higer end radios since then but still use a 4450 for my base. if you have specific question email me and I will help out.

<First, the national simplex for ham is not FRS, but rather 20 MHz down
(442.500).>

National simplex Freq's

146.520
223.500
446.000

NOT 442.500

the above is for FM. Side band is another whole set of freq's that are
"national calling freq's"

That radio isn't type accepted for FRS use at any rate. It couldn't
be legally used even if the power was dropped.

9884. Re: [GMRS] Manual for KENWOOD TK-340 UHF User Programmable Radio ?

Try www.kenwood.net for your manual. The original source is always the best.
If not, then try:

(www.servicemanuals.net - CD-ROM: $16.99)
<http://www.servicemanuals.net/(c0vplurndyu4zm55bi112u45)/results.aspx?type=SM
&brand=16&model=tk-340>

(www.manualman.com - $25 for service manual)
<http://www.manualman.com/catalog/news110.htm>

I did the homework for you. =c)

9886. Dingotel and GMRS?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-06-22 05:23:59 UTC
From: Brian R. Chapman
Topic: 9886 Message: 9886

What's the definitive scoop on the Dingotel and GMRS? My personal opinion is that this device/service would be a great addition to GMRS if used by properly licensed users and implemented correctly through repeaters with PL on COR much like IRLP and Echolink. I'd be very interested in everone elses opinions on what rule changes might be in order and how to make this a viable way to link remote repeaters together from time to time , say Chicago and St Louis area. Also what other radios besides the Motorola Talkabout are compatable ie Vertex, Kenwood etc. ? What's the pin out (3)conductor into the HT ? Thank's Brian n9noc/kaf2088

Not that I want to jump into this legal beagle thread but I'm not using it as an FRS radio. I'm licensed for GMRS and assume that if it meets part 90 (And is capable of 5 watts) this is kosher. But look before 100 guys tell me whatever I'm not really that interested in a major anal exam on GMRS regs and type acceptance issues.

Thanks for the nice reply. Man some of the other guys on this thing are pretty worked up.

I hate to admit I'm not sure what DSC is? I know what tone encode / decode is and what I was trying to do was set it up so that the recevier would only open (for example) if 100 Hz Tone was present - and of course I was sending the same tone on transmit.

Official is not the correct wording. I've seen it noted in a QST article. Look, I think people are reacting in a negative way thinking this is some encroachment on FRS or whatever. ALL I'm saying is that some Hams have mentioned that if they are going to use "a" FRS channel why not Channel 7 Tone 3 "73"

Ok?

Right I understand about 446 MHz. What I've seen is that hams who use FRS all program in Channel 7 Tone 3 so that they can meet other hams on the off chance they are using FRS close enough. Am I the only one that has seen that?

Based on the uniden bubble pack I have, the Motorola ht600 6 channel radio that's programmed to ch 17,19,21,16,17,21. I have two duplicate channels, I've read somewhere that ch 1 is suppose to be used for emergency? I want to have at least one of the duplicate channels re-programmed to the emergency channel.
My other concern is repeaters, how will I know when I'm using a repeater? I don't want to offend anyone by unauthorize use of a repeater.

Hi Guys,

In the FCC Part 95 rules, a GMRS station (HT, mobile, base, etc.) is allowed to transmit up to 50w of power.

Are they referring to 50w ERP or 50w TPO? It doesn't say anything (from what I remember) about power AFTER an antenna or other source... Any thoughts?

Stan,

Keep to the simplex frequencies (462.xxx) and you should have no problems. If you have "channels" that include 467.xxx frequencies, and your communications go thru, then you found a repeater.

Unless you are wanting to use a repeater of to find one, I'd stick with the simplex freq's altogether.

As for that "emergency" frequency, it's not really an emergency frequency to begin with. Most GMRS users recognize it as a frequency to hold emergency comms on, but doesn't have to be just for that, nor do some folks in the US have a repeater or other service on that frequency unless noted or stated elsewhere. But anyways, the frequency is 462.675 MHz, and the PL (or CTCSS) code is 141.3 Hz.

Good luck with the programming!

Ryan,

That is 50W output from the rig. I don't think there is a limit on ERP.

Subpart A_General Mobile Radio Service (GMRS)

Sec. 95.135 Maximum authorized transmitting power.

(a) No station may transmit with more than 50 watts output power.
(b) [Reserved]
(c) A small control station at a point north of Line A or east of Line C must transmit with no more than 5 watts ERP.
(d) A fixed station must transmit with no more than 15 watts output power.
(e) A small base station must transmit with no more than 5 watts ERP.

Here's what a retired FCC lawyer (who probably wrote the regulation) has to say about GMRS max output power:

Question: "Does the 50 watt power limitation on GMRS refer to the ERP or to the power output at the antenna jack?

Answer: "Transmitter power output (key-down carrier power or PEP), measured at the output jack."

Dwight,

I thought I had it somewhere, but lost it. Let me ask you this:

- What or where are you going to use the radios?
- How much are you willing to spend?
- Do you want a bubble-pack or a commercial radio?
- How much time are you going to be on your radios?
- Will you want to expand to a repeater system in the near future?

The reason I ask you this, is so we don't send you a general answer which probably won't help you at all. By answering these (or adding others as well), we can help you better by determining what you actually need, and what your budget can hold.

Now just so you know, there are no GMRS base stations (except audiovox, but is not worth it), only HT (hand talkies) or mobile radios. Now most people turn their mobile radios into a base by adding a base antenna on to it (with a tower in some cases), and does work for their needs.

But I won't cover anything else until we can figure out what you need. =c) It'll help you as well in the long run.

The FCC is tricky. Ask yourself one question. When was the last time anyone had an FCC official come in and test the power output of a transmitter. They base their decisions on what they find in the RF field outside of the transmitter. Thus for the neat little antenna's on the top of that big expensive van. Much the same way they fine cable companies for excessive leaks. It is when the system is spurious, or causing harmful interference that they will send someone in to do a system check. Think how they think and you will have the answer. Keep the system clean, a low profile, and chances are, you will never get harassed.

Mathew

Okay,

That's what I wanted to know. So if you have a 3dB gain on your antenna, it'll be 75w ERP... Just wanted to make sure when I install our new repeater that we're not going over the limit. So it's TPO.

Thanks to all, and 73's!

Hi Ryan--

Keep in mind that just because you're _allowed_ to run 50 watts TPO doesn't mean you must. You might want to back it off for several reasons:

- it doesn't do much good to cover an area you can't hear. If you're on a mountain, and have line-of-sight to a very wide area, by all means run the limit. If you're on your roof at 25 feet in a vally, your 50 watts aren't going to help you hear much better.

- It may seem obvious, but more power out requires more power in. Particularly at UHF. If you're collocated at a radio site, that might not matter, but if you're at home, it might. Particularly in California.

- Putting more power into the antenna might require a bettter (more expensive) duplexor with more isolation, feedline, antenna, etc to avoid causing self-interferance / self intermod. If you're in a high RF environment (like the top of Cheyenne Mountain (where NORAD is) or Lookout Mountain -- both here in Colorado, with hundreds or even thousands of transmitters... One of our guys got stuck on Cheyenne because his car-alarm wouldn't un-lock the starter on his car), you should add a circulator/isolator to keep the junk out of your transmitter-- junk getting into your transmitter can sometimes be amplified and come back out of your transmitter at a much higher power.

Those are just a few that come to mind.

Ryan,

I want a base and mobile setup that will allow me to keep in contact with my home withing about 10 miles or so. I have 2 sets of bubble pack radios for short range applications, so I need something along the lines of a commercial radio. The use will be daily, and I'm not planning on expanding to a repeater system. As far as I can tell, the nearest repeater is about 50 miles away. I'm flexible on price. Thanks.

Which is not what I want to be known as. Which is also why I asked. Yes, to obey the laws (however hard and difficult they are to understand), but not to have a low profile. Am I supposed to be hiding from something, and allow my units to operate out of the maximum transmitting power. Don't think so. Sorry.

3dB is double, or 100 watts.

" .. 3dB is double, or 100 watts. "

That assumes there are no losses in the feedline, connectors, SWR/POWER meters, duplexer, etc. - which is of course, not possible.

With 50' of a low loss (at 467MHZ) feed line, and a typical duplexer loss (assuming a very high quality duplexer that is very tightly tuned) the net 'gain' of signal at the horizon would be anywhere from unity to a dB or two - giving you an ERP of 30-50W for the 50W TPO from the radio.

There's no way for a roving van to exactly measure your ERP unless they know the TPO, antenna spec, cable specs, duplexer loss, installation losses etc. That said, an experienced field enforcement tech for the FCC could fairly accurately estimate your TPO based on the field strength reading of your signal at a known distance from the transmitting antenna. If it appears to the FCC that you are out of compliance, they could mandate an inspection of your radio gear and then measure TPO directly.. not a likely scenario unless there was a complaint about your station and the tech believed you were Way-Way out of spec,

Right. They are happy to have people use directional antennas thus getting more ERP. The limit is intended to be the output of the radio. If you hook it up to a 20 element Yagi or just a Ground plane its all good.

I have 1 Kenwood Protalk TK3130 UHF Radio for Sale
Currently Programmed with 8 GMRS/FRS Frequencies.
This is a 1 watt radio with scan, VOX , Scrambling.
Was purchased as a test radio for my employeer but higher ups decided
we needed to go with 800 so this is no longer needed.

Includes drop in charger, battery- also can use AA's, belt clip,
manual and box.

This radio can be programmed to cover from 460-470 mhz.

$85 plus shipping.

Contact me here or at stmills@...

Steve.

9920. Re: [GMRS] radio recommendations

There are alot of companies that can be used with a GMRS system, such as Kenwood, Icom, Yaesu, GE, Motorola, Ritron/Jobcom, and a few others.

If you want a new radio, then look up their website, review their radios and locate a local radio shop. If you want used, then try eBay, craigslist.org, eham, and other used radio websites (mostly for ham, but also have alot of gmrs/uhf - 450-470 - radios as well).

Prices for new are going to range from around $100 to $600+. Used radios are going to be much cheaper, starting with $10 and rising to $80 and up. If you are interested in used, I'd start with eBay first. That's where I got most of my equipment.

Good luck and 73's!

From: Charles
Topic: 9921 Message: 9921

Hello,

I am going on a camping trip up to the UP of Michigan. I have a 50 watt mobile in the car(kenwood 880) with some portables, and I am intending to use GMRS to coordinate my camping activities with my family. Is USA and Canada GMRS on the same Frequency? Is it that you can't use the Frequencies pairs listed (462.650 and 462.700)? Or is it that you cannot use GMRS entirely? Thank you for the input.

9924. Re: Motorola HT 600 questions

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-03 17:20:59 UTC
From: Bob
Topic: 9894 Message: 9924

Stan:

I use an HT600 as my combo GMRS/Ham radio (plus, because of its size, it makes a dandy nutcracker, wheel chock, or defensive weapon!). I'm afraid I don't know "bubble pack" channel numbers, but I think I can offer some thoughts:

Repeaters simultaneously transmit and receive on different frequencies; if they didn't it would be like a dog chasing its tail and feedback would ensue. So, if on a given channel you can transmit to another portable AND hear it back directly, that channel is considered "simplex" and will not be set up for a repeater. Likewise, if you can hear your other portable, but it can't hear the HT600, chances are pretty good the 600 has that channel set for repeater operation.

Further, most repeaters operate with sub-audible tone squelch (aka CTCSS, PL, CG, etc.) and unless your HT600 happens to be programmed for both the radio frequencies AND the appropriate CTCSS frequency for a particular repeater, you probably won't have to worry.

Finally, if your HT600 does have the right combo of radio frequencies and tone squelch to activate a local repeater, you'll most likely know fairly quickly. Most repeaters have a second or two (or longer) of "hang time"--a period of time in which the repeater transmitter continues to operate after the receiver no longer hears an incoming signal. Thus, if you were to key your HT600 and say your callsign, you would hear the repeater "answer" with a few seconds of hang time (indicated by light hiss from your speaker), then possibly the *chunk* of the "squelch tail".

Good luck...hope this helps!

Unless you held a previous license that authorized operation on 650 or 700, you can't use these channels pairs within about 75 miles of Canada. It doesn't matter that Canada now has a license free radio two watt service that includes 462.650 and 462.700 MHz.

Hopefully, the FCC will realize that protecting Canadian business band interests on these frequencies is no longer necessary and they will lift the ban on using them.

Topic: 9931 Message: 9931

Hi all,

I just got my GMRS license, and am interested in trying to use a repeater to communicate with my family. I live in Ann Arbor, MI. I know there is one repeater here (675) but I don't know if that one is open for use. I believe it belongs to Corwin Moore, but I was unable to contact him by email. Does anyone know if this repeater is available, or of any other open repeaters in this area?

Also, I'm soon likely to be moving to Bloomington, Indiana, and I was wondering if anyone knows if there are any open GMRS repeaters in that area?

Thanks!

David, WQDA362

your link is an email, and not a ruling.
the indication that cable modem is OK while DSL isnt is absurd.

Also, I think you will find that that little reference to "wireline
control link" will be your downfall.

No, my friend, I think you are eager to read what you want to believe,
and you missed the point of their response.

It's good that you provide the case number, because those who disagree
can appeal to this specific case. Unfortunatly I dont have time to
get involved to this level.

Linking for the purpose of carrying on two way conversations is NOT a
wireline control

> were waiting for a ruling.

This has not been a ruling. We are exactly where we have been in
the past. All anyone has been told is "as long as it is not
connected to the PTSN"

Nothing has changed. Again this can be considered in violation of
FCC regulations until a *specific* application is addressed by a
specific subject, instead of the generic responses everyone has
been receiving.

Topic: 9930 Message: 9936

The UK radio licensing authority did approve the eQSO linking of PMR frequencies (8 narrowband channels centered on 446.005 - 446.0095). In the US, 446.0 is the '70cm calling freq.

PMR in the UK (certified radios, 1/2W, fixed antenna) is the equivalent of the US and Canada's FRS.

A few visitors from the UK have been bringing their PMR radios with them to the US. I've heard them in NYC and in central Florida.

is it good or bad.. we'll have to see.

Topic: 9938 Message: 9938

Visitors to Doug Smith's BBS are invited here:
http://groups.yahoo.com/group/praorg/

GMRS Web is down temporarily until issues with the ISP are resolved.
Hopefully we can all return to our favorite GMRS-related BBS soon.

The Personal Radio Association Yahoo Group has been opened to
accommodate all members of Doug's BBS. Here we can carry on
discussion, and can relay updates.

It's a meeting place where we can all keep "in the loop"

I correct my previous statements. The use of a phone line was addressed by the original poster, via his website.

Evidently a cable modem or other medium is required to access this system. As such, NO DSL, or Dialup internet users may access his interface.

The original posted needs to put up a warning on his website, that such DSL or dialup users cannot use the system and must be verified.

I am sure once this is attended to, many folks can start to relax and put the controversy behind us.

Then, what needs attended to is to get this DingoTel stuff off the market.

9944. Realignment of Kenwood TK-370

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-15 13:53:59 UTC
From: David Wild
Topic: 9944 Message: 9944

All,

I just got hold of a slightly battered Kenwood TK-370 (not the G model) that I'd like to use for GMRS. However, it appears to be transmitting and receiving about 30KHz off frequency. Does anyone know how to realign these radios? There are several potentiometers on the board, one marked BAL and another DEV, but I don't want to start fiddling without knowing what I'm doing. Also, if anyone knows where I can get hold of a service manual that would help too

Thanks!

David, WQDA362

Take it to a Kenwood dealer that knows
what he/she is doing. You will be much
better off and happier if you do so. They
have the proper test equipment, etc. It will
be like new when you get it back.....

9946. Re: [GMRS] Digest Number 1414

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-15 16:12:23 UTC
From: Bill Cornett
Topic: 9946 Message: 9946

I just started getting this newsgroup, and it seems like a good resource. Many thanks to the knowledgable individuals who contribute time and experience.

My question is similar to the one earlier from the fellow who was looking for a base station solution for GMRS. Let me outline my needs, and we'll see what can be come up with. I'm not an amateur radio licensee, but I have messed around with 2-way radio a bit, especially during the CB craze, and I build electronic flash units for my studio, so I have a fair amount of electronic experience, at least enough to know what I don't know.

I live just outside Washington, DC, in Maryland. I use GMRS a fair amount to keep track of my kids, especially when they or I am walking the dog around the lake next to my house. The HT's I have right now go just out of range at the places I need them to go, which is distances of about a mile, with obstructions (hills, buildings, etc.). The HT's are 1.8 watts. I also have the Radio Shack tabletop base station, which works quite well within its range limitations.

As I see it, my options are:

1. Get a pair of the newer 5-watt bubble-pack HT's which boast a 14-mile range, and might do three miles around here.

2. Try to find a repeater to join, but I can't see spending ten bucks a month for the next several years.

3. Get some sort of better base station.

My guess is that all I would really require is a better antenna for the base station, but of course for that I would need a ham-grade unit with the ability to hook up to one, and from what I read a decent antenna can run 50 bucks and the coax that much more. I'd like to keep the price of this project down to about $200 if possible. I like the idea of a unit that runs off of 120 AC as that way we can keep in on all the time and just grab a HT as we go out the door.

Even with the above considered, I'm starting to lean toward the 5-watt bubble-pack HT's as a simple and

cost-effective solution. Having my own repeater would be the ultimate, but the more I read about them the less I think I could put one in cost-effectively, and I'm not sure any of the bubble-pack units I already have can hook up with one.

Has anybody used one of those 5-watt HT's in an eastern US suburban environment, and if so, how far will they really go?

Many thanks for all help. -BC-

9947. Re: GMRS for Family Use

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-15 22:12:49 UTC
From: Lake Hodges Radio
Topic: 9946 Message: 9947

Bill,

There is no such thing as a 5-watt bubble pack GMRS radio. Some bubble packs claim 5 miles but the are 3 watts or less. 5-watt radios like the Icom F-21GM are $80 used on eBay and $150 new. They also require a family license for $80 for 5 years.

You can find used GMRS repeaters on eBay for $300 to $600. New for $900 or $1000. The self-contained Kenwood repeater units are pretty good. Plan to spend $40 to $80 for a good rooftop antenna (like a Cushcraft) with 3db or 5db gain if you want good range. The ICOM F-21GM handhelds will work with a repeater and so will Motorola T-7200 handhelds which costs about $70 used or $120 new.

Depending on how old your kids are, consider having everyone get a ham license. 12-year old kids have passed the technician test. 15 and 16-year olds find it rather easy if they're motivated. There are probably 50 or so free ham repeaters (2 meter and 70cm) within range of where you live. You could probably talk to your kids from 50 or 100 miles away via ham repeaters.

GMRS is mostly short range. A good high-elevation repeater system in MD might get you 50 to 80 miles. We max out around 150 or 200 miles here in SoCal but we have 8,000 foot mountains on which to place the repeaters.

Amateur radio is a better way to go than GMRS if you want to talk more than 5 miles. GMRS will cost you more after you pay the $80 license fee or buy a repeater. Get your ham licenses and get yourself and your kids some Yaesu VX-2s or FT-60 handhelds. They're nice and small. Used prices on eBay are reasonable. You can use them with the available free ham repeaters.

If your kids are too young for ham, another good alternative is MURS. These are two watt radios and do not require a license. You CAN put an antenna on your roof or a tower or in a tree. These operate around 151 MHz (close to 2 meter ham) and thus propagate better than GMRS. With a good rooftop antenna and good hand held radios, you might work as far and 15 miles simplex, if there are no obstacles in the way. From hilltop to hilltop in MD, even 25 to 30 miles from based to handheld might be possible. Plus, there is less interference on MURS than on GMRS.

9948. Re: GMRS for Family Use (2)

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-15 22:30:13 UTC
From: Lake Hodges Radio
Topic: 9946 Message: 9948

At 09:12 AM 07/15/2005, Bill Cornett wrote:
>As I see it, my options are:
>1. Get a pair of the newer bubble-pack HT's
>which boast a 14-mile range, and might do three miles around here.

Or far less, depending on your terrain and surrounding buildings. The larger problem will be interference and profanity on nearly every FRS and GMRS channel in a major urban area.

>2. Try to find a repeater to join, but I can't see
>spending ten bucks a month for the next several years.

Most ham repeaters are free. You can also get access to GMRS repeaters by joining a REACT group, but sometimes those are restricted to REACT business, not for family chit-chat (although there are exceptions).

>3. Get some sort of better base station.

This would be doable. You can buy used GMRS mobile rigs for $50 to $100. Connect one to a 15 or 20amp AC to DC power supply ($50 or less on eBay) and configure a base station with 35 to 50 watts output. Connect to a good rooftop antenna with some gain ($40 to $80) and you might get 10 to 20 miles range on a good day, especially if you're on a hill. Get some god handhelds (not the cheap bubble packs) such as the ICOM F21-GM or Motorola T-7200 that I mentioned earlier.

You cannot use Ham radios on GMRS legally since they are not FCC approved for that, but many people do. Icom, Yaesu and Kenwood 440MHz HTs can be made to on GMRS with a few (illegal) mods described in many places on the Internet.

Perhaps you will spend $200 $300 or more like I did on a family GMRS system. It is also likely that you will be disappointed. Later, when you get your technician class ham license you will kick yourself and say "WHY DIDN'T I DO THIS SOONER?!"

>Even with the above considered, I'm starting to lean
>toward the 5-watt bubble-pack HT's as a simple and
>cost-effective solution.

That's fine and its cheap, but don't expect more than 1 to 2 miles of reliable range unless you live WAY out in the country and can talk from hilltop to hilltop. Also, if you're near a city or town, be prepared for your kids to learn some new words that I wouldn't want any kid in my family to hear.

Good luck,

-- Kurt, CA

9949. Re: Thousands of Free Repeaters

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-15 23:16:12 UTC
From: Lake Hodges Radio
Topic: 9949 Message: 9949

Bill,

If you want to have a lot of fun with two way radios, my suggestion is to get an Amateur Radio Technician license and use 6 meter, 2 meter and 440 MHz repeaters.

There are THOUSANDS of Amateur Radio repeaters OPEN for use FREE in the USA and beyond.

Using Echolink (www.echolink.org), you can talk over repeaters from coast to coast and even in some counties in Europe and Asia.

ANYONE can get a Tech license. It's easy. 12-year old kids can pass the technician test.

Free practice tests -->> www.qrz.com

Join this group -->> http://www.arrl.org/join.html

Find an Amateur Radio club in your local area -->> http://www.arrl.org/FandES/field/club/clubsearch.phtml

BUY a copy of the ARRL book "Now You're Talking" and you can have your Technician license in a month or less.

-->> http://www.amazon.com/exec/obidos/tg/detail/-/0872598810/qid=1101225881/sr=8-1/ref=pd_csp_1/104-1258998-5793543?v=glance&s=books&n=507846

Good luck!

9950. GMRS Repeater System (3)

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-15 23:08:19 UTC
From: Lake Hodges Radio
Topic: 9950 Message: 9950

Another option...

There are some Kenwood TKR-820 GMRS-capable repeaters on eBay right now (items 5789031974 and 5789032086) that could sell for $300 to $600. That is the range they have sold in the past. You'll need to get someone (radio shop or ham radio operator) to configure it for you... duplexer, channel selection, PL tone, etc.) 462.575 is often a good frequency to use. Avoid 462.675 because that is over-used. .500 .550, .625 and .700 are also good choices in some areas. (Search eBay for Kenwood repeater to see a few more items...)

Put up a rooftop antenna or small tower with a UHF antenna such as a Cushcraft Ringo Ranger. Buy some of the ICOM and Motorola HT radios I spoke of before.

Be sure to get your family GMRS license for $80 on the FCC Web site -- http://wireless.fcc.gov/uls/

You can buy a complete family system with 3 - 5 handheld radios for $700 on the low end, $1,200 in the middle range or $2,500 on the upper end. If you have a good location, you might get 10 to 15 miles reliable range and up to 30 miles talking to a 25 watt mobile station in the flatlands or 80 miles from mountaintop to mountaintop.

My GMRS system includes a Kenwood TKR-820 repeater with duplexer ($600) tuned to a 462.575 output (channel 16 on bubble pack radios), Cushcraft UHF Ringo Ranger Antenna ($50), and several ICOM F21-GM and Motorola T-7200 handhelds ($60 to $120 from eBay). I also have two ICOM U-400 mobile units ($60 to $100 on eBay) and a Pyramid PS-14KX 12VDC power supply to make one of the U-400s into a base station. Total cost about $1,600. I use magnet-mount UHF antennas on my cars connected to the ICOM HTs to boost their range (The Motorola radios have a permanent antenna and cannot connect to an external antenna). Some of my friends have spent up to $2,500 on their family GMRS systems.

I am on a 900 foot hill and my TKR-820 family repeater has a reliable range of 20 miles in several directions. The best we have done is 40 miles occasionally to another hilltop about 3,000 ft high but the signal is variable. We also use a commercial GMRS repeater on a 6,000 Ft. mountain that covers a 60 mile radius, meaning that we can talk up to 120 miles across two radii. There's a REACT GMRS repeater on an 8,000 foot peak near us with a reliable range of about 80 mile radius that provides a 160 mile range for two mobile units on opposite sides of the coverage area.

2 meter FM Ham repeaters do slightly better because 144 MHz propagates about 20% farther than 440MHz or 462HMz with all other things being equal (same elevation, high-gain antenna, etc. One FM Ham repeater in our area provides about 200 miles range between mobiles. On SSB, you can work up to 2,000 miles on 2 meters when ducting conditions occur. Mountaintop 6 meter Ham repeaters (54MHz) do even better... up to 500 miles occasionally.

Get a copy of "Now You're Talking" from ARRL to learn more about repeaters and propagation...
http://www.amazon.com/exec/obidos/search-handle-form/104-7823955-6967158

Another good one is AC6V's FM repeater guide... http://ac6v.com/FM101.htm

Good luck,

-- Kurt

Mario,

Check with Bob at the R.K. Leef Company about Maxon -->> http://www.rkleef.com/

Email: <http://www.rkleef.com/contact.htm>kb6don@...

It also might be cheaper to buy a new radio.

You need to also post your question in the body of the message.

Anyway. I too was confused until I bought a pair of RadioShack radios
with their own version of QT.

This allows a group to talk on a special set of CTCSS tones, different
than the 38 tones typical to most consumer radios. It is a sort of
"private call". This function remains enabled until 20 seconds have
gone by without either party transmitting.

On my RadioShack units, each handheld can be set to have its own "ID"
Say, if there are 3 people, all on the same channel and CTCSS tone,
one person can page any one individual without the others hearing.
The option to page the whole group is also there.

This can keep you from disturbing other members of your group when you
only have a message that pertains to one. It allows ALL members of a
group to have a CTCSS set, but still have the benefit of selective
calling.

The Motorolas may or may not have this Call ID function, but the basic
function is similar.

9955. Re: Setting up a family radio system

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-18 02:26:23 UTC
From: Bill Cornett
Topic: 9955 Message: 9955

Kurt and Ed-- Many thanks for all the info. I didn't know about the MURS radio service at all. That might be worth looking into. Do the units available for it have CTCSS?

Amateur is most likely not viable right now, as my kids are all under ten and show absolutely no inclination towards radio. Maybe me later. Another aspect of it is that I will probably find myself running comm ops for local running/athletic meets, and it would be good to have radios that I can just set on FRS and toss to people. I don't know for sure, but I'm assuming that there's no such thing as repeaters on FRS.

Midland and I think Cobra have come out with full 5-watt FRS bubble pack radios that boast a 14-mile range (yeah, over water with the wind blowing in the right direction), but as I say, I'll only really need a couple of miles. (See URL at bottom of message)

So far the CTCSS on FRS has kept my radio fairly quiet and bad-word free. It's on channel 7 and quiet code 7 and only squaks with fringe noise a couple of times a week, even though it's turned on 24/7.

Here's the URL for those Midland bubble-pack 5-watt units.

http://www.we-are-walkie-talkie.com/shop/product_info.php?products_id=2062

Again, many thanks. You guys are a great resource, and armed with all that info I could feel confident about tackling a base station project.

I'll let you know how it goes. -Bill

9958. PRA Membership drive

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-19 11:53:11 UTC
From: John L. Wilkerson Jr.
Topic: 9958 Message: 9958

The Personal Radio Association is now accepting applications for membership. Membership is currently free, with no dues collection, until such time the group is incorporated and a dues schedule is approved.

The PRA will become the primary voice of the GMRS community. Already, PRA members have reported many FCC violations to the FCC, who is initiating enforcement action.

GMRS users, and users of any of the services the PRA supports (FRS/MURS) are urged to check it out.

The PRA Mission Statement

The Personal Radio Services are limited radio spectrum resources set aside by the United States government for use by the general public as licensed and unlicensed radio services. The PRA is a mutual-interest organization of Federal Communications Commission licensees of the licensed General Mobile Radio Service and interested persons using the radio services delicensed by rule, the Multi-Use Radio Service, and the Citizens Radio Service. The PRA's mission is to fairly and accurately represent its member's interests in these radio services before government agencies, the various representatives of the radio industry, private or public organizations, and the public-at-large in order to protect and preserve the growth, regulation, and continued usability and effectiveness of each radio service.

The PRA Ethics Statement

The PRA supports the lawful use of the Personal Radio services as defined in the the Federal Communications Commission's Rules and Regulations and the various Communications Acts as amended.

The PRA supports the Basis and Purpose, as well as the Definition of each radio service as written in the Federal Communications Commission Rules and Regulations and remains loyal in this regard during any deliberations before federal or private organizations.

The Personal Radio Association proactively supports and openly defends the core interests of personal radio users before government and private decision makers.

PRA and its members subscribe to an Operating Code of Ethics that is consistent with the FCC□s Basis and Purpose for each radio service, all applicable FCC Rules and Regulations, and with an emphasis toward

expected growth, continued usability and the cooperative use of each
radio service.

PRA promotes cooperation among members and non-members sharing the
same radio spectrum in the same geographical areas.

The PRA promotes a Radio Industry Code of Ethics that encourages
industry to act responsibly toward the Personal Radio Services.

PRA Focus in Brief

FCC rule making and enforcement issues with an impact on the radio
service(s)

Commercial actions toward the radio services that effect members
continued enjoyment of their investment in a negative or a positive
way.

PRA Initiatives

Reporting retailers using false, misleading, or deceptive advertising
to market two-way radio, or that advertise illegal radio hardware to
the Federal Trade Commission and Federal Communications Commission
respectively.

Public education regarding use of the Personal Radio Services.

GMRS Intruder reporting via PRA form through the PRA Intruder
and FCC Enforcement Committees.

Encouraging FCC enforcement of GMRS FCC Rules in problem areas of the
United States.

PRA's Reliable Retailer Program. We focus attention on retailers doing
the right thing applying the Radio Industry Code as a standard.

Keydown Focus Group. This group gathers information on illegal CB
radio keydown events and reports findings to the FCC.

The PRA is headquartered at Huntingtown, MD.

9960. Re: GMRS Radio Performance (UHF 462-467 MHz)

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-20 15:39:09 UTC
From: Lake Hodges Radio
Topic: 9960 Message: 9960

At 07:59 PM 07/19/2005, James Mayfield wrote:
>Take a look at the Midland GXT500 at: The report shows that on high power,
>this radio has an input into
>the final amplifier of 9.84 watts. ERP is 1.515 watts. James

James, you're right. The bubble pack companies play all kinds of games with specs. All bubble packs are fairly poor in performance.

Try this -- buy a Midland GXT500 and an Icom F21-GM. Compare the two. The Icom will far outperform the Midland bubble pack. The Icom is only $20 or $30 more in cost.

PLUS -- the Icom can be connected to an external antenna. (I use a 3db gain magnet mount roof antenna on my car with my F21-GM, and a 5db CushCraft UHF Ringo Ranger on the roof of my house -- resulting in an ERP of 15 watts or so. You could even attach a small UHF amp and boost it to 40 or 50 watts.) Using an external antenna, the F21-GM's performance is so far superior to a bubble pack that they are in a completely different class.

PLUS -- The Icom F21-GM works in duplex mode allowing me to use GMRS repeaters. None of the cheap bubble packs will work with repeaters except for the Motorola T-7200, which again, cannot use an external antenna. Sure, you can cut off the antenna and solder and modify a bubble pack to accept an external antenna, but that's a violation of Part 95 and takes some effort and it still won't perform as well. In addition, the receive side of bubble packs are inferior and the audio is lousy.

Bubble packs are toys. Why not just buy a REAL radio, such as the Icom F21-GM? They're $75 to $90 used and $120 to $160 new on eBay and other places.

(Note: Midland also makes a REAL radio -- called the 80-400 which operates on both GMRS and Amateur 70cm frequencies.)

Look here -->> http://www.rkleef.com/

Good luck! (also see below)

==========

If you want to have a lot of fun with two way radios, my suggestion is to get an Amateur Radio Technician license and use 6 meter (50MHz), 2 meter (144MHz) and 70cm (440 MHz) repeaters.

There are THOUSANDS of Amateur Radio repeaters OPEN for use FREE in the USA and beyond.

Amateur radios will FAR outperform GMRS. A 10-year amateur license will cost you $10 to $20 versus $80 for a 5-year GMRS license.

On 6 meters you can sometimes talk hundreds or even thousands of miles (simplex, point to point) when the band opens.

Using Echolink (www.echolink.org), you can talk over 2m and 70cm repeaters from coast to coast and even in some counties in Europe and Asia.

ANYONE can get a Tech license. It's easy. 12-year old kids can pass the technician test.

Free practice tests -->> www.qrz.com

Join this group -->> http://www.arrl.org/join.html

Find an Amateur Radio club in your local area -->>
http://www.arrl.org/FandES/field/club/clubsearch.phtml

BUY a copy of the ARRL book "Now You're Talking" and you can have your Technician license in a month or less. Some people can get their tech license in a week....

Hello all,

I have many questions that I would like to ask, maybe some got answered but I don't remeber. Let me beging by laying why I got GMRS I got GMRS because my fiancee wants nothing to do with ham radio but she bought into the idea of GMRS. Now here come the questions,

1.) In about two months or so I will be getting married to my fiancee. In two weeks i will be moving in with ther? Can she leagally use my callsign?

2.) Can mobile radios that transmitt 50 watts at high power be used at base radios as long as it is on simplex?

3.) About Line A, it runs through Duluth, MN. Does this mean I cannot GMRS all together or just the freq. the FCC talks about on the License. Can some one explain line C to me? I live in MN and I guess I don't understand that?

thanks,

Thay can used as base units. Base units are perfectly
legal. You cannoot communicate with other base
stations, as GMRS forbids base-to-base comms; but you
can certainly use it otherwise.

> 1.) In about two months or so I will be getting
> married to my fiancee. In two weeks i will be moving
> in with ther? Can she legally use my callsign?

John, a perfectly legal way to talk with your fiancee TODAY is to use the GMRS/FRS shared (interstitial) channels. These are channels 1 to 7 on an FRS radio.
You can operate with your call sign with up to five watts. She can operate without a license at 500mw or less.

Get her a little FRS radio and use channels 1 to 7 -- these are: 462.5625 462.5875 462.6125 462.6375 462.6625 462.6875 and 462.7125.

Always use your FCC call sign when you use your GMRS radio. With an FRS radio she does not need an FCC call sign but can use a "tactical" call sign such as "Red Bird 5" or anything else that she wants to make up.

Good luck!

Bob, GMRS WPVV845, Amateur KG4WAD, LMRS WPXC892

9965. Re: questions

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-23 12:40:51 UTC
From: Doug D.
Topic: 9961 Message: 9965

To expand on John's answer to question #2:

A mobile used as a "Base Station" at up to 50 watts must have frequency stability of 0.00025%. To qualify as a "Small Base Station" the radio system including antenna (which cannot be more than 20ft higher than the structure it is attached to)is limited to 5 watts ERP with a frequency stability of 0.0005 (The Motorola M1225 and SM50/120 radios are both Part 95 and meet the 0.00025% requirement.)

95.621(b) Each GMRS transmitter for mobile station, small base station and control station operation must be maintained within a frequency tolerance of 0.0005%. Each GMRS transmitter for base station (except small base), mobile relay station or fixed station operation must be maintained within a frequency tolerance of 0.00025%.

Now for the line a/c part (I too am not sure where line C is either)

From a GMRS License:Effective 2/16/99 the GMRS rules have been amended and you may operate on any of the primary or interstitial channels shown in section 95.29. Exception: Licensees who operate North of Line A and East of Line C may not operate on channels 462.650 MHZ, 467.650 MHZ, 462.700 MHZ and 467.700 MHZ unless your previous license authorized such operations.

So if you are north of line A and east of C you are limited to using 5 watts ERP for .650 and .700. However you have the other 6 pairs available .550 .575, .600, .625, .675 and .725 for 50 watts.

In regard to Base to base commuminications, they are permitted and legal. 98.55, the rule that prohibited base to base communications was deleted in the major overhaul of the GMRS rules in the Feb. 99 revision. There is no language in the current rules that prohibit it. (check PRSG website http://www.provide.net/~prsg/p95aeuls.htm for information regarding this deletion and the other changes in this major rules overhaul)

Don't you just love the simplicity of the GMRS rules ;)

Date: 2005-07-24 00:43:26 UTC
From: gmrs1411
Topic: 9967 Message: 9967

ADVISORY MESSAGE:

The GMRS repeater operating on 462.6750 Mhz serving The New York City Metro Area is fully operational at this time.

Due to a system re-design and upgrade this repeater was temporarly unavailable for use.

Persons requesting "Travellers Assistance" or "Public Safety Emergency Communications" may access this repeater using the following parameters:

TX: 467.6750 Mhz.
Encode Private-Line Code = (1B) 107.2 Hz.

RX: 462.6750 Mhz.
Decode = "Carrier-Squelch"

Note: You (MUST) remain in "Carrier-Squelch" mode in order to operate thru this repeater at all times.

Please utilize your assigned FCC Callsign and clearly identify yourself upon access of the repeater.

Respectfully Submitted,

Kevin Parrish

> in with ther? Can she legally use my callsign?

If she is your aunt or your niece, she can use your call sign now it
now. Otherwise, you have to wait until after the wedding.
You won't believe how many aunts and nieces some GMRS licensees have (grin)...

95.179 Individuals who may be station operators.
(a) An individual GMRS system licensee may permit immediate family members
to be
station operators in his or her GMRS system. Immediate family members are the:
(1) Licensee;
(2) Licensee's spouse;
(3) Licensee's children, grandchildren, stepchildren;
(4) Licensee's parents, grandparents, stepparents;
(5) Licensee's brothers, sisters;
(6) Licensee's aunts, uncles, nieces, nephews; and
(7) Licensee's in-laws.

> 2.) Can mobile radios that transmitt 50 watts at
> high power be used at base radios as long as it is
> on simplex?

Yes... they can even operate 50 watts duplex with repeaters on the eight
approved repeater frequency pairs.
You must drop down to five watts or less on the seven GMRS channels shared
with FRS (FRS channels 1 - 7).
A base station running five watts or less is called a "small base station."

>>You cannot communicate with other base
>>stations, as GMRS forbids base-to-base comms; but you
>>can certainly use it otherwise.

I don't think that is correct. Re-read the new GMRS rules -->>
http://www.provide.net/~prsg/part95ae.htm
You are referring to the old rules. Base-to-base comms are now legal and
are very common.

(f) Except for a GMRS system licensed to a non-individual, a mobile station
or a small base station operating in the simplex mode may transmit on the
following 462 MHz interstitial channels:
462.5625 462.5875 462.6125 462.6375 462.6625 462.6875 and 462.7125.

These channels may be used only under the following conditions:
(1) Only voice type emissions may be transmitted;
(2) The station does not transmit one-way pages; and
(3) The station transmits with no more than 5 watts ERP.

> in with ther? Can she legally use my callsign?

John, a perfectly legal way to talk with your fiancee TODAY is to use the GMRS/FRS shared (interstitial) channels. These are channels 1 to 7 on an FRS radio.
You can operate with your call sign with up to five watts. She can operate without a license at 500mw or less.

Get her a little FRS radio and use channels 1 to 7 -- these are: 462.5625 462.5875 462.6125 462.6375 462.6625 462.6875 and 462.7125.

Always use your FCC call sign when you use your GMRS radio. With an FRS radio she does not need an FCC call sign but can use a "tactical" call sign such as "Red Bird 5" or anything else that she wants to make up.

Good luck!

From: A10382
Topic: 9961 Message: 9973

The actual distance from the "Line" to the border varies.. in some areas about 50 miles, in most it appears closer to 75 miles. The "Line" is drawn for much of its length, on a latitudinal (or for the Alaska/Canada border on a Longitudinal) basis. The reason for this buffer zone is to keep US users from interfering with Canadian Public Safety and business users that are assigned some of these same frequencies.

In return, the Canadian gov't also does not assign some frequencies along a similar buffer area between Canada and the US/Alaska

The Canadian licensing agency (Industry Canada) does do a somewhat better job at enforcement of the regs than is done in the US for the citizen services (FRS, GMRS, and MURS). Of course, the population in Canada is a fraction of that in the US and the large majority of Canadians do live in the 300 mile band just north of the US border - north of there it's verrrrrry cold much of the year.

Before GMRS became a service intended for individuals, GMRS frequencies were actually coordinated to insure that multiple users in the same geographic area did not interfere with each other. The license application required survey info such as Lat/Lon coordinates, antenna height, number of mobiles, and even an intended operating radius around the tower. The frequency coordinator then used that information along with propagation software (and their local knowledge) to attempt to keep multiple users on the same frequencies far apart. Users further cooperated with their assignment of tone codes to help even more - a far cry from the morass the FCC created by certifying dual service radios (FRS / GMRS) and then failing to do any real measure of enforcement. In fact, the FCC does not have anywhere near the resources needed to effectively enforce GMRS. Enforcement actions all seem to be 'token' ones - where a especially egregious violator is made an example of. I only wish the FCC would better publicize the large fines against individual users and small businesses. Then, many restaurants would stop buying VHF 'long range' cordless phones and car service, package delivery, and even small contracting companies would actually get licensed and stay on frequency.

Commit a telecom violation like intentionally running an unlicensed system in many countries and your business would become history AND you'll end up spending some time in the local gulag.

I believe that "Line B" is similarly situated along the US-Mexican border - but good luck getting the Mexican radio authorities to uphold their end of the bargain. The US agreed to not allocate some frequencies close to the border that might interfere with Mexican gov't, military, and business users. However, the Mexican gov't has expended little if any effort in regulating or enforcement on their side (what's new!), A lot of Mexican taxi companies, businesses, gov't and other unlicensed users south of the border routinely interfere with legitimate licensed users in the US - from 'sea to shining sea' (San Diego to Brownsville).

Frank

I found some very interesting data on "line a" on the internet. While the site deals with amateur radio, "Line A" affects both Amateur and GMRS operations. Seattle, which is about 120 miles south of the Canadian border, is NORTH of "line a".

This is a pretty comprehensive site, complete with references to let people check whether they do in fact live south of "Line A".

From: David Wild
Topic: 9976 Message: 9977

Hi Eric,

I've used both, and both are nice radios. One difference is that the TK-3101 only puts out 2W, whereas the Icom can do 4W. I actually use the IC-F21 (not GM) which is nice in that you can program non-GMRS frequencies too, although you then either need the programming cable & software or have to get it programmed at an Icom dealer. The benefit of the GM is that you can set repeater / CTCSS tones right from the radio. The Kenwoods are a little more compact, but there's not much difference. I think it gets down to aesthetics and personal preference. If I had to choose, I'd go for the Icom.

Hope that ramble helps a bit!

David, WQDA362

Lots of comments on Canadian rules and regs. Here's a question regarding Canadian FRS/GMRS rules, if anybody knows the answers or where to find them.

As a professional photographer, there are times when I use FRS radios to coordinate aspects of shoots, places where an assistant and I may be within shouting range but it would be very unseemly to raise voices. On a visit to Canada, I saw a shot I want to create, and I plan on going back to the same exact spot this year or next. It will entail putting a bagpipe player on a spit of land on Lake Huron, with the sun setting in the background. The spit is about two hundred yards away from the shore where I will be shooting, and it would be nice to be able to clip an FRS radio on the bagpipe player and transmit instructions to him while I shoot.

Here are my questions:
1. Is it legal for me to bring my FRS radios to Canada and use them there? (I'm a US citizen.)

2. If not #1 (perhaps because of frequency/power differences, etc.), would it be legal for me to purchase FRS radios or the equivalent thereof in Canada, and use them there?
3. If indeed they do have FRS equivalent service in Canada, and numbers 1 and 2 are not possible, would my only legal recourse be to bring along a Canadian citizen to transmit the directions via the HT's? (aside, of course, from going through the trouble of finding a cooperative and suitably equipped ham up there).

Many thanks for all assistance. -Bill

No additional licenses are needed. Your GMRS license is for the users - not for the radios.

You can operate an unlimited number of GMRS base stations, HTs, and repeaters on your license... which kinda make that $80 sound cheap..

Is there anyway (short of using a parrot box) to get bubble pack radios to use a repeater? Unless you were to switch back and forth between channels (transmit on one/receive on the other) it seems like you'd have to get a higher end radio to use a repeater... am I correct? (That or setup a memory scan to scan the receive channel.. but still allow transmission on the transmit channel)

From: Buley, Kenneth L (GE Consumer & Industri
Topic: 9980 Message: 9989

Higher-end GMRS "bubble pack" radios have the repeater channels programmed in already. FRS "bubble pack" (or any other FRS radios) aren't legally allowed to use repeaters (even "parrot boxes").

Kenneth Buley
Bullitt County EMA Deputy Director CD-2
Bullitt/Spencer Counties Red Cross ECRV Driver/Operator BC-6
Bullitt County ARES/RACES Coordinator KY4DES

Subject: [GMRS] Re: Repeater Question

Is there anyway (short of using a parrot box) to get bubble pack
radios to use a repeater? Unless you were to switch back and forth
between channels (transmit on one/receive on the other) it seems like
you'd have to get a higher end radio to use a repeater... am I
correct? (That or setup a memory scan to scan the receive channel..
but still allow transmission on the transmit channel)

Check that. I think the repeaters use the upper
non interstical channels for receive and the
bubble packs won't go there.

9996. Re: [GMRS] Repeater Question

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-29 17:04:01 UTC
From: A10382
Topic: 9980 Message: 9996

There are NO restriction as to where your relatives may live and still operate under your license. They only need to operate in the areas governed by the FCC (USA, US possessions, US registered aircraft, and US flagged vessels at sea). Once you land in another country (other than at the US embassy/consulate), you are bound by the rules of that country.

Please be sure to read the list of relatives in the rules. It includes immediate family members. Cousins, Aunts, Uncles are NOT included. Don't make assumptions.. READ THE RULE YOURSELF (47CFR95.179) :
http://a257.g.akamaitech.net/7/257/2422/12feb20041500/edocket.access.gpo.gov/cfr_2004/octqtr/47cfr95.179.htm

There is a caveat in the rules. The relatives listed (READ THE RULE!) are NOT automatically entitled to use your license. The actual wording is: "An individual GMRS system licensee may permit immediate family
members to be station operators in his or her GMRS system. Immediate
family members are the: ".
NOTICE THE WORDING "MAY PERMIT".. In the federal rules, That's very different from just "MAY" !
READ THE RULES YOURSELF. A LOT OF PEOPLE ARE VERY MIS-INFORMED.

And remember, YOU as the licensee are responsible for the operation of any relative whom you permit to operate under your license. That means that any fines come to the LICENSEE, not the relative.

Keep yourself out of trouble. The phrase "RTFM" is very applicable (and very good advice) when it comes to the FCC rules.

No offense meant to anyone, but unless you should have the rules in front of you when quoting -- otherwise you will most likely mislead others. Too many people take what they read as gospel if the writer / speaker 'sounds knowledgeable'. The same is true in the amateur radio community.. with lots of even 'old timers' incorrectly quoting the rules or even quoting some that do not (and never did) exist.

For GMRS, the list of relatives includes In-Laws and other relatives who are not actually 'blood' relatives. REMEMBER, the rules say the licensee "may permit"... the listed relatives to operate. It's not automatic.

The actual wording is in section 95.179. I could post it here, But I would rather you look it up read it for yourself. I find myself not truly remembering all the nuances and have to constantly refer to many of the sections each time a question arises.

READ THE RULES YOURSELF. That way, YOU will know where the rules are:

Part 95 rules:
http://www.access.gpo.gov/nara/cfr/waisidx_04/47cfr95_04.html

Specific section of the GMRS rules noting operation by relatives of GMRS licensees:
95.179 -- in the above web site. Look it up and read it.

The URLs noted above are for the gov't source. A lot of other web sites (clubs, schools, radio resellers, etc.) have rules listed on their own web sites that are not up-to-date. These rules above include all changes made thru 30 SEP 2004. Any changes during the year do appear in the Federal Register at least 30 days before they become effective (along with federal rules for EVERYTHING from Apple growing to Zebra raising) and are incorporated into the web site at the beginning of the NEXT federal fiscal year (01-OCT- 2005 is the next update). However, that does not excuse you from not knowing the CURRENT rules including any changes made during the year. I guess the FCC expects you to subscribe to and read the weekly Federal Register - something that virtually no one in the radio comm world (except for communications lawyers/law firms and radio manufacturers) actually does.

You are right about that! There is an official
looking faq that comes up early in a google
search that says "immediate family...blood
relatives". Seems a direct reading of the rules
is much more accurate.
Joe

10000. Re: [GMRS] Repeater Question

Yahoo group: GMRS (2005 — 2007)
Date: 2005-07-29 17:56:24 UTC
From: A10382
Topic: 9980 Message: 10000

Hi Kenneth,

Right you are...
I do look at the rules ... and still misquoted.

This should be a perfect example to everyone to read the rules themselves.

Most of the sections in the Part 95 ('citizen services) rules, despite being written by FCC lawyers, are pretty readable by us mere mortals.

On the other hand, some sections are complex and full of legalese. Some even seem to conflict somewhat with other sections. To make it even more complex, some sections of the rules do not use the name of the actual service they apply to in their section title. This is true of many parts of the federal regulations (aviation, maritime, telecom, commerce, etc).

This whole process keeps a lot of lawyers and law firms in business. What's surprising is that the FCC itself only has a few thousand employees (with many admin and clerical functions now being outsourced). At least it's not the Federal Farm programs where there is about one gov't employee for every farmer !

tk-840-1 is a 450-480mhz radio
tk-840-2 is a 480-512mhz
tk-840-3 is a 403-450mhz

the radios are 600 conventional channel radios I have one ang like it. in the radio you can put channels in groups by kind. I have 3 groups in mine and going to add a 4th.

good luck with the info i think the 840 is worth buying.

As a reply to the bubblepack question:

I'd either use the Motorola T7200 or the Cobra models (exact model unknown). Both have a price est. of $120. But with all radios that include the FRS channels/freqs, the highest wattage is only .5 watts for FRS and 1 watt for GMRS. I'd suggest to buy some cheap FRS units, and some HT radios specifically programmed for GMRS. In this way, you can use the full legal wattage for GMRS simplex AND duplex, and also have a set of FRS radios that still allow you to stay within the legal range.

My two cents. 73's!

Adding to Mike's answer for you, Ben...

Make sure that the TK-840 has a "D" in the model number. This tells you that it is specifically meant to be used for the GMRS bands (part 95). I don't have any, but was told this by an old friend who had several of those radios. And yes, they are awesome radios that will serve you for years to come. I'd also try out the TK-805 as well.

Then Cobra is operating and selling radios that are not legal per Part 95 of the FCC rules.

I could be wrong, and that a radio with FRS frequencies, may have up to 5 watts for GMRS, but I'm pretty sure that only up to 1 watt for GMRS is allowed. There are reasons for this.

Now if you find the rules stating this (or if I do first), then post it for us.

I'm not one of those guys who are picky with rules and others, but am stating on what I know...

Part 95.29

(f) Except for a GMRS system licensed
to a non-individual, a mobile
station or a small base station operating
in the simplex mode may transmit
on the following 462 MHz interstitial
channels:
462.5625, 462.5875, 462.6125, 462,6375, 462.6625,
462.6875 and 462.7125.
These channels may be used only under
the following conditions:
(1) Only voice type emissions may be
transmitted;
(2) The station does not transmit
one-way pages; and
(3) The station transmits with no <<<======
more than 5 watts ERP.

Since most "rubber duckie" antennas actually show a loss compared to a
dipole, then 5 watt portables are perfectly acceptable and meet FCC
specs for use on the interstitial channels.

So I was talking to this local 2-way radio shop about getting some radios for a camp. He asked what we were using now.. I told him FRS radios... but we were looking for durability. He offered to program some CP200 Motorola radios at 4 watts on the FRS channels we are using now. ACK! I thought you could only do 1/2 watt on FRS? I asked him this and he said "well these radios will do 4 watts".

DEFINITELY ILLEGAL! Use of FRS legally requires an
official type-accepted FRS radio. These radios are
NOT type-accepted for FRS use.

They *may* be type accepted for GMRS use, however.
You'd need a license to use them, though.

Thank you Craig, for the adult reply, calling me
an idiot. Your age shines through.

My point, was, what did the two way shop
employee do that was illegal? Who are
you going to report him to?

The FCC? Do you really think they care, or
would do anything about it, even if there was
an offense?

Who cares enough to try to take action? There
is no agency that does!

What would you propose that you or I do to
make a difference? Other than educating the
guy in the shop, pray tell, what would you propose?

What are YOU going to do to make a difference
about it?

10016. Re: [GMRS] Illegal?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-02 17:43:06 UTC
From: Ben
Topic: 10010 Message: 10016

A better answer is to get VHF business radios that will operate on the MURS frequencies:

151.820 MHz
151.880 MHz
151.940 MHz
154.570 MHz
154.600 MHz

You can use up to two watts of power, no licence is requires, and it is legal to use it for business purposes. The MURS frequencies are former VHF business band frequencies, so you should not have too much trouble findingdurable professional radios that can be programmed for your needs. If you were doing ok with the FRS radios you should be very satisfied with the range and quality you get with 2 watts with a decent VHF radio.

You will have to share the frequencies with other users, same as FRS. So get radios that have CTCSS (PL).. what you may know as "subchannels".

If you don't want to get a pro radio for everyone.. if you want some people to have small cheap ones like the FRS you use now, you can get cheap MURS radios too. They aren't as plentiful as FRS and GMRS but they are out there. For example:

http://cgi.ebay.com/COLUMBIA-2-Two-Way-Radios-MURS-up-to-5-Miles-BLACK_W0QQitemZ5793701129QQcategoryZ20382QQrdZ1QQcmdZViewItem

The PRA and its members report violators constantly.
We have our own form to report violators and send the
report to the FCC. The FCC, likes our reporting form
and is acting on them.

10018. Moderator... please post link to PRA

Craig... how does running four watts on a shared FRS/GMRS channel ruin things for everyone?

We have guys in California running high power and jamming all kinds of repeaters and public service frequencies and causing massive problems.

It takes the FCC YEARS to catch up with this guys (if ever).

Do you really want the FCC diverting scarce resources to chasing a guy selling four-watt radios to kids to use on half-watt channels?

Really?

What is the practical difference between a half watt and four watts at a kids camp, probably in the middle of nowhere, where no one else can hear them anyway?

(BTW, Five watts on FRS channels 1-7 is totally legal, IF you have a GMRS license and a type accepted radio. Channels 1-7 are SHARED FRS/GMRS frequencies.

OH... you started a fire here! I'll get the links posted now!

Look on the PRA website for open actions. I'll post the link for one fine levied.

http://hraunfoss.fcc.gov/edocs_public/attachmatch/DA-05-1611A1.doc

This was the result of complaints files by a PRA member.

Believe me.... we are getting things done. The more members we get, the more of a voice we will get.

Since you are ignorant of the PRA, why don't you take a look! Go by popularwireless.com too and stop by the forums.

I will give you this - one COMPLETED action, as i asked,
as a result of someone making a complaint.

I would also state that ONE completed action does NOT
make a strong showing of FCC intent. Lets see in a year.

I have looked at the PRA web page, and seen the letters
that they have posted. Remember, those letters are NOT
completed actions, they are simply requests for information.

Almost automatic.

The PRA is only a couple months old. Actions will increase exponentially as we get older.

I challenge you to go to the Popular Wireless BBS and read about everything that is going on!

>
> I have looked at the PRA web page, and seen the letters

They are the first stage of *FCC ENFORCEMENT!*

You don't need to believe me. You need to inform yourself. Things are changing, whether or not you believe what I say. Yours is only one opinion. The facts speak for themselves. For a brand new organization we have managed to get the ear of the FCC. Our founder is a personal friend of Riley H. now. The people calling for the delicensing... or "licensing by rule" of GMRS have been squashed. (Sorry Vince) We have to battle the commercial interests that threaten GMRS, which will prove to be a very difficult task.

We are getting a meeting with various FCC officials here in the near future.

I needn't continue. You need to find out all of this by yourself.

You can post as many links as you want...

There is NO practical, perceivable difference between 500mw and 4 watts on a UHF FM channel in terms of interference caused to other users. I, for one, don't want to see taxpayer dollars spent on even discussing that.

Instead, go after the guys jamming aviation frequencies, fire channels in cities, police frequencies, and those swearing and jamming 2 meters repeaters or running illegal kilowatt rigs on HF and broadcast band frequencies.

Government is already too big and wastes way too many dollars on activities that have no measurable impact on the quality of life for the average citizen.

Let's demand that government(and the FCC) prioritize its activities to operate efficiently and not expend ANY resources on wasteful initiatives that will have no positive effect on anyone.

Good luck!

You really don't know?

Well, he offered a 4 watt UHF FM radio to an unlicensed person who should not be using more than 500mw. Never mind that 5 watts is legal on shared FRS/GMRS channels if you go to the trouble of sending $80 to the FCC for a GMRS license.)

In the middle east, I'm sure he would have been stoned or beheaded for that.

-- K

P.S. (Yes... I have paid my $80 for a GMRS license to operate legally on GMRS. Never mind that 16 million people who purchased bubble pack radios in discount stores last year didn't bother to do that. Let's see, 16 million offenders times two enforcement employees at the FCC... hmmmmm... maybe Riley and Bill can prosecute them all by the year 5005 or so...)

Enforcement of regulations DOES serve the radio services in which
applicable regulations are enforced, and has a very positive effect.
The FCC is in the business of enforcing regulations. Fines collected
can therefore convince Congress to give a better budget, thus
encouraging more enforcement.

Again. You do not have to believe me, or agree with me. That is of no
consequence. Go and see for yourself. I just state my opinion too. I

am one person.... one person that TRULY supports GMRS! The hard facts are there for anyone to read. You just need to go and READ the information.

John,

The squeaky wheel gets the grease. The FCC has
drastically downsized their enforement branch, leaving
only a few to work on any complaints, being more interested
in seeing how much money they can bring to the coffers
by holding auctions, and letting big industry overrun end users.

Unless you have your head in the sand, you know the above
is true. Rebanding is a prime example of the FCC method
of enforcement.

Riley does a great job, but don't think for a minute that he
has vast resources available. Even in public safety complaints,
much of the work still depends on the private sector - via
coordinators, and local radio shops. I have spent many an hour
with the FCC field people searching out interference. (anyone
from MO or IL remember the 155.340 incident a few years back?)

The lack of support that Riley sees from his agency is indicitive of
the way the present FCC is headed. Ask Phil Kane! The old FCC,
the one that had teeth, and was not afraid to use them, is almost
completely gone.

Do I like it? Not a bit. However, I am a realist. A complaint from
someone claiming that someone offered to tune a non compliant radio
to FRS frequencies is not going anywhere. Many users are going to
be unlicensed. Many users are going to use higher power. No matter
how big an organization gets going, that is the way it is going to be. Look
at 2 meters in NY.....

PRA may be able to stave SOME of it off, and if they do, my hat is
off to them. I have said for a long time, often right here in this mailing
list that a new organization is needed to represent GMRS and FRS,
and I certainly hope that the PRA will do that. The only other
organization that offered to do so, was a private individual calling
himself an organization.

Here's the history. In 1995 when I first went into GMRS and started what is now PopularWireless.com the FCC was not involved in GMRS enforcement at all. It was abundantly clear. The repeater group I belonged to iNorthern California was perpetually plagued by commercial intruders and later of course bubble-packers.

We got the local FCC involved by meeting with them. Before I left Northern California the local FCC Field Office had worked through a list of some 115 or complaints and RESOLVED most. The rest of the United States was not so lucky.

Using the BBS we actively suggested that GMRS licensees try the same approach. It worked in some areas and did not work so well in others.

The PRA didn't just start up yesterday. It has been starting for the last ten years. The people pushing it, myself included, have worked very hard to get the FCC's enforcement cooperation. Those letters you make light of are extremely significant. These letters represent a new approach on the the part of the FCC to help us deal quickly and effectively with all types of violations. Three have already been resolved, one is awaiting comment, one was sent to a field office for DF. We are awaiting info on the remaining complaints. Several more have been sent since. Please note that we are also part of the priority mix that EB has with all complaints. It is SIGNIFICANT that Riley Hollingsworth is now working complaints.

What we are seeing here is the result of several years experience with the FCC on the part of many volunteers trying to make a difference. Alot of folks don't know or understand that this has been an effort a long time in the making. Several of us just decided to do what it took to make a difference through an association. That's what we are involved in now. The FCC appreciates NUMBERS. It is a politically driven organization. GMRS cannot survive unless licensees organize.

Don't think for a minute that we don't know what we have ahead of us. We look at each action as a victory. We know we need thousands of members to be truly effective. I agree with your response 100%. I, myself, look at things realistically, and will speak my mind when overenthusiastic members, or board members start thinking too big.

We've been in existance only a few months.... will we be here in a few years? Who knows.

Will we save GMRS? Who knows?

Someone has to do something. Are we these people? We hope so. Time will tell.

Join the PRA. Go to the PRA reporting form, fill it out, mail it to
the FCC, as well as submit it via email to the PRA.

You need to know the exact location of the offending system, the
frequency, and CTCSS tone, if any. You can then provide other
information in the narrative, like hours of operation, kinds of
traffic, etc.

You will find a ton of help from a lot of wonderful people on the
Popular Wireless BBS.

You should also record the traffic. The part about it being illegal to disclose anything you hear
on a scanner ONLY APPLIES TO LAW ENFORCEMENT. Actual recordings are very useful to the FCC!

No there isn't.. at least not where we'd be using them (in the middle of no-where).. but what if I was using them in inter-city philadelphia.. or for an amusement park. That 4 watts just took out a channel for anyone for several miles to use.
With my GMRS radio at 3 watts I can cover close to 2 - 3 miles handheld to handheld. If I'm using a 4watt FRS radio for BUSINESS PURPOSES that channel is pretty much unusable for anyone else.

Actual recordings are very useful to the FCC!"

Justin, you might ask US Congressman Jim McDermott,
who got into hot water for releasing a tape recording
of a cell phone call of then Speaker Newt Gingrich if
the "illegal to disclose" only applies to law
enforcement. You might also ask the Florida couple
who did the actual recording and paid a $500 fine to
the FCC for their actions...

FCC has accepted recordings, they are the main reason why these jokers get caught. Cite me a case
where the FCC DIDN'T use recordings to help prosecute a person transmissing illeagally! This has
nothing to do with phone conversations or wire tapping, this is over the air unauthorized communication! Prime examples control operators recording their reepeater to help track a jammer.
Are you going to sit there and tell me they did something illegal?
Justin

I suppose I need to clarify a bit. It doesn't matter if you are an individual or a business on FRS. Regardless of the use, you MUST use a type accepted FRS radio with a power output of no more than 500 mW.

The radio shop is in violation of FCC regulations for programming a radio in the FRS band to exceed the maximum permitted power output, as well as using a non type accepted radio.

Typically, nowadays, all you will find are 22 channel FRS/GMRS "hybrid" radios.

You may use channels 1-7 for any use whatsoever, including business, IF you keep your power output at 500 mW or below. Radios typically have a power selection IF they can exceed the 500 mW rating.

IF you exceed the 500 mW power setting you MUST have a GMRS license. Business operations CAN be done, IF every person using the radios is licensed.

You may use channels 7-14 for any use whatsoever, including business.

Channel 15-22 Require A GMRS license for ALL use, whether personal or business. Again, business traffic cannot be done unless all persons using this radio have their own license. Businesses cannot be licensed by themselves, Unless they are covered by the grandfather clause and renew a previously existing business license.

I hope this fully clarifies your original message.

Going to be a tough road to hoe on that, for a couple of
reasons...

1. He offered to program it, nowhere does it say he DID.

2. Ultimately, it is up to the end user to be on the right
frequency and with the right equipment.

the best part here, is the person USING the radio will get any fines and may lose the radio's. Had a company here a number of years ago that lost there radio's and got a fine all because they were not right no license and no the person that sold radio's at the flee market had not trouble .

Blake and group,

Many of us have been working on creating the the PRA for many months now. We have been met, as expected, with glee as well as skepticism. We also have people afraid that the wheels are beginning to turn. Illegal radio systems all over the country have been shut off IN ADVANCE of calling the FCC by our "membership", which will be going public very shortly pending our finalized legal documentation. We are collecting membership applications as we are within weeks of completion. If you chose not to believe that its happening, we cannot force you. You have the right to be skeptical, and thus have the right to be left behind.

Takes time to get things done. In the mean time, I will echo the sentiments of my counterparts:

There have been a considerable number of submissions to the FCC for pirate businesses and users which are currently under investigation. The proof will be in the pudding when the actions are taken care of. Yes, that takes time too. Nobody needs to believe anything anyone says, however, make no mistake, it is occuring. Your quote: "Show me a completed enforcment action that the PRA has gotten the FCC to do?" will be a full plate here in the next few months.

Now, part of the issue is related to a shop which arbitrarily programs frequencies into a radio to help their customer. It is common knowledge in certain circles across the US that the FRS/GMRS frequencies are a dumping ground for businesses which are too cheap or refuse to ante up the required fees for licensing in the appropriate place, thus causing the current "pirate" problem. Those business are being systematically targeted for enforcement actions and they all "Blame the radio shop". This in turn finds a radio shop with a visit from an Agent for inspection.

Now, I tend to agree with Blake that a radio shop technician could theoretically program any frequency into any radio and say its good to

go. Really, whats stopping him. Well, placing frequencies into a radio that its not intended for, knowing its beyond power output recommendations, is bad practice and ethics. Maybe the FCC agent will be sitting outside when he kerchunks the radio as a test and its all over. But really, what's stopping them other than their repuation? Many have none and will continue to do it until they learn people are organized and listening.

So what WILL stop them is when their business clientel gets served NOV's from the FCC and word gets out. No customers, no business. If this is the way the game is played, so be it.

What is the PRA going to do about it? There are many things ALL of us users can do about it. Education is key, education with consequences. Let the illegal business owners know that the radio shop they patronize has put them in a bad position to get fined and radios confiscated and suggest alternatives. We had a business here on a high powered repeater, PLACED THERE BY A RADIO SHOP! We've worked with them, without involving the FCC thus far and they are licensed in the business band. However, some are not that easy and those are off to the FCC. Simple.

It takes all licensees, not just me, or you, or the PRA. The PRA is intended to be the focal point where the masses (or whatever term you desire) can meet and create programs which are effective across the USA.

I don't think we need to call names on one another. Work together. We can get more done that way.

Maybe it was a type accepted radio?

Maybe he assumed the user was going to get a GMRS license and operate on
the shared FRS/GMRS channels (1-7).

Tough case to prove. Last time I checked, people in the USA were innocent
until proven guilty.

Has that been changed?

WE DO!!

If idiots like that guy think that they can rule the world and add more wattage to FRS/GMRS radios, then there will be chaos. Just don't buy the radios, and send in a report to the FCC. Pretty easy. Also spread word of what he's doing, and no one will buy from him.

Hey, could your vigilante group also see what you can do about drug dealers in the inner cities? That would get great if you could!

One of these days, the grandson of a member of congress is going to go to a discount store and buy an FRS/GMRS bubble pack radio. He's going to go off to scout camp and chat with a couple of his friends on a GMRS-only channel (15 to 22). Someone is going to prosecute him. Then watch how fast the FCC will remove the requirement for a GMRS license for UHF FM operation of five watts ERP or less.

Anybody remember the 11 meter CB band? When was the last time anyone sent in a check for a CB license?

Look below, read carefully.

http://wireless.fcc.gov/services/personal/family/
Family Radio Service (FRS) is one of the Citizens Band Radio Services. It is used by family, friends and associates to communicate within a neighborhood and while on group outings and has a communications range of less than one mile. You can not make a telephone call with an FRS unit. You may use your FRS unit for business-related communications.

Isn't it amazing how one question, that was a pretty simple question to begin with, turns out into a huge arguement?

Obviously, the guy at the radio shop doesn't know that this is wrong. Maybe if we told him, he would be aware. However, since it is the responsibility of the programmer AND the buyer to know what he/she is selling/buying, it would also be the responsibility of the user to know what's right and what's wrong.

<<"And I would ask again, what did the shop

employee do that was wrong?">>

Nothing in his opinion. Everything in ours. It's how you view the question/problem that makes a huge and complete difference. The employee doesn't know, so therfore, inform him of his mistake and inform him of the fines/rules that the FCC has.

This isn't hard. It's just one's opinion that screws up the rest.

Overall, the employee didn't know what he did. So we should have informed him. See how simple this could have been? =c)

Okay, this type of comment is unecessary. It is not a vigilante group. Furthermore, your statement makes no sense because the FRS unit on GMRS frequencies do not share the same rules. You need a license to talk on GMRS frequencies. Your reply is speculative and uneducated.

Honestly... I have nothing more to say on the subject. I made my point. Others made theirs. Those of us here who are PRA members know what is going on, and are committed to our mission statement. That is plain and simple fact. Disagreeing with us does nothing to change facts. It just give us a better view of what we are up against... and helps guide us in the proper direction to overcome these challenges.

That is my final comment on this specific line of discussion.

From personal experiance, the FCC has neithor the time or the funds to aggresively investigate the small time offenders-be they business or not. It is exactly like CB-too many radios that are simpley to easy to get and use. One can walk in to any truckstop, Radio Shack or any other consumer electronics outlet and buy the bubble packs. Most of these don't know and/or don't care about licensess-probably don't even read the manual.

Is it really plausible that the FCC is going to go after the Jones because they are using unlicensed GMRS equipment in thier own back-yard? Probably not.

As a Trucker-I see these radios in use in countless warehouses, truckstops, and other business. There is no way the FCC is going to investigate and take action unless there are serious issues of intentional interference or other serious malicious misuse.

The license in it's self is nearly pointless. There is no test, no way to show one is qualified, nor anywhere to show why one needs a radio. All one has to do is throw some money at the goverment and in a few day, a call sign shows up on the ULS of the WTB. So what.

Just my opinion.

I think that the FCC violation is great when I DO find the guys with drugs and an unlicesnsed radio I can make it a Federal case instead of a state case. and yes drug dealer do use these radios in the drug trade. I will and do prosecute both the unlicesed radio and the drug distrabution!!!!!!

the law is the law no matter if you were just going 10 miles over the limit or it was just a little marijuana.

the popo cares too

From: David Wild
Topic: 10075 Message: 10075

All,

I just got hold of a Kenwood TK-880, but it appears to have a problem. The screen lights up when power is supplied, put pushing the on/off button just results in a click and nothing apparently happening. Does anyone have an idea what the problem might be? I'd like to eliminate something simple before taking it into a shop. I've already made sure that the power is being supplied the right way round and at the right voltage.

Thanks!

David, WQDA362

David,

I'm thinking that it may be stuck in program mode... Is there anything that appears on the screen?

Ya know, it could be a "sticky" button. This means that theres dirt between the button contact ad the circuit board contact. This happens to most older radios due to age, weathering, and heavy usage in the past. (this also happened to my tv remote)

I'd take it to a radio dealer and have them clean the radio, or you could do it if you know what you're doing.

That's the odd thing - absolutely nothing on the screen. It doesn't appear to respond to any buttons except the power on/off in which case it makes a thunking noise through the speaker every other time the button is pressed (indicating, I suppose, that it's turning on). I tried holding down the MON button but nothing came out of the speaker. Any idea how to reset the radio?

It seems pretty clean and new, but I will check that out

Thanks!

A couple of things shoot this down,

1. Collecting those fines can be tough...

2. Those proceeds go directly into the general fund, NOT the FCC coffers.

3. It would still be nowhere near what a frequency auction brings them,
for LOTS less work.

So has anyone loaned out thier gmrs repeater to emergency services? Like maybe have a portable repeater to setup and portables? I see you can also loan it out for civil defense training, has anyone done this?

thanks,

chris

Hi John

Can you send me info on PRA Program. And membership info, and send it to me at my personal e-mail, and not on the list.

Thanks

10088. Any new GMRS-specific radio models?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-06 19:17:13 UTC
From: John H. Guetherman
Topic: 10088 Message: 10088

I haven't been here in quite a while. I was wondering if there's bee
any recent introductions of new GMRS-specific radio models,
particularly those that are a step or two above "bubble-pack" quality.

I picked up a used Icom IC-U16 handheld at Ham Radio Outlet for $100
a few months back, but it needs a new battery pack.

John H. Guetherman
KB7MIB/WPXJ598

From: kvsp1160@aol.com
Topic: 10088 Message: 10089

Welcome Back John! Glad we could have you again.

Not to my knowledge of any new bubble-pack-like radios on the market. We discussed linking repeaters via VoIP, and a bunch of other good topics, but no new radios.

Of course, I'm one of over 1200+ that can give you an answer. =c)

Hope to hear from you soon, and on future discussions.

73's,
Ryan

Hey,

Garmin has a new Rino 130 out that is GMRS. It has the weather Band and has 24 megs of memory. Also has a Barometric Altimeter. The Associate at Bass Pro Shop at Discover MIlls Mall said that Garmin is marking all of the GPS /GMRS stuff down to get ready for a new line of GPS stuff.

Thanks

10092. Answer to question

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-07 20:33:14 UTC
From: bob98521
Topic: 10092 Message: 10092

Guetherman mentioned reading something about a new mobile. Although the Midland MO-4032 is not "GMRS specific" since it covers 430-470 mHz., we will be shipping it already programmed with FRS/GMRS in channels 1-7 and GMRS in 8-15. We will also program it so the user can change tones from the front panel.

The radio is a 32 channel 5/45 watt FCC certified for Part 90 and Part 95. It also legally qualifies as a base radio. Programming kits will be offered as an option but MANY functions (other than frequency) will be available from the front panel for user. First shipments are expected next month (finally!!!). Price and other details will hopefully be at www.rkleef.com by Monday or Tuesday on the Information Sheet DATED 8-8-05

Joe - The address you gave did not work for me ("can not be found").
I know as of about a week ago the Owner's Manual your address refers to had not been published yet on the 32 and 128 channel models (MO-4032 and MO-4128). Maybe it's there now but I can't see it.

Anyway, the Midland Web site to be mentioned at my own Web site www.rkleef.com will say that you can see the picture and read specifications at http://www.midlandradio.com/comeersus/store/comersus_viewItemasp?idProduct=4384 This should work right now.

Still hope my Webmaster has this up by 8-8-05.

Joe - Thanks. The second address is exactly the address that will appear on our Web site revision due to be made today(?). I have been using it for several weeks, and now I see the User's Guide is available and can be reached from there too. For whatever reason, I was getting an error message yesterday but today all seems well again.

Along with a sample radio from Midland we got last week there was a User's Guide Supplement with front panel programming information with LOTS of choices. If the supplement is not included in the Guide when radios arrive we will make copies and be sure each radio gets one. We also plan to include our own Quick Programming Instructions (as we do for other models we supply) for a few of the most used functions such as changing tones.

This sample actually runs a little over 50 watts.

Bob

10112. Power Amp for ICOM F21GM ?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-22 00:33:45 UTC
From: Chris Catotti
Topic: 10112 Message: 10112

Can anyone recommend a power amplifier for use with the ICOM F21GM, both mobile and as a base unit?

Chris Catotti

Topic: 10112 Message: 10113

Chris, I hope you are kidding.

Any uhf amp will cost you more than a good used mobile. Most rf amplifiers suitable for the F21 will put out 20 to 30 watts, and will cost about $60 used to $150 new. My wife just bought 2 Icom 420's for $200 and $15 shipping, that is $107.50 each (used). I frequently pick up TK-840's and M120's for $60 to $75 a piece.

If you really do feel you need an amp, look for TPL uhf on eBay.

Topic: 10112 Message: 10114

Actually I'll correct this. I bought a Motorola 35w (15A) power amp on eBay for less than $30. It was a mobile amp, but can be used as a base if you buy a converter ($25). Still works the same way, but depends on where you're going to use it.

Try eBay, and do a search for "uhf power amp" or whatever else you want to search for.

If it works, it doesn't have to be new. 73's!

I have a TPL that I have not used in many years. For a while it was used with a handheld as a mobile in my car, then with an Astron SL-11A power supply for a base. You are probably aware that to use it on channels 9 through 15 would exceed the legal limit of 5 watts.

10116. Seeking PD-202 UHF Base Station Antenna

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-24 00:58:40 UTC
From: George Helser
Topic: 10116 Message: 10116

This is a UHF omni antenna for 450-470 MHz. I heard a cellular company was dumping
them cheap to move their systems to a higher frequency.

A friend gave me the model number PD-202 but it could be PD-201-7?

If I cannot find one of these, I will be looking for a good omni, up to 8? tall, to put in my
attic. Suggestions are welcome!

Regards,
George

10121. GMRS 462.550 w/107.2 PL, Phoenix, AZ area

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-25 00:47:06 UTC
From: John H. Guetherman
Topic: 10121 Message: 10121

There's a fairly active General Mobile Radio Service (GMRS) 462.550 repeater in the Phoenix, AZ area, with a PL of 107.2.

I believe some of the users may be dual ARS/GMRS licensed, by the nature of a few of their conversations mentioning Ham radio stuff.

Just general info.

Bob,

I'm not aware of a 675 machine having been on Mt. Ord. There was one on the White Tanks west of the Valley, but is no longer active. (The Phoenix Neighborhood Patrol was using it without proper licensing at one time a few years ago. They have since moved elsewhere.)

There may stil be a 575 machine up on the Rim somewhere, that sounded like was being used by a radio shop serving Rim communities, but I haven't done that much monitoring recently.

The Shaw Butte 550 machine has been most active with the 107.2 tone recently, but many other tones are available from the owner, according to someone else on another group.

John - It was there until Superstition REACT could no longer afford the monthly space rent a couple years ago. I thought maybe they came up with the money or made some arrangements to keep going. Guess not. They have probably been reduced to simplex use. White Tanks was good coverage West on I-10. Perhaps as paying commercial customers on GMRS left, owners took their repeaters out of service.

I HAVE A USED PAIR OF RADIOSHACK 19-903 5 WATT
15 CHANNEL GMRS HT'S WITH BUILT IN BATTERY PACKS AND CHARGERS IN
EXCELLENT CONDITION. BATTERY PACKS SLIDE OFF OF BOTTOM FOR QUICK
REPLACEPMENT IN FIELD. BATTERIES DO NOT NEED TO BE REMOVED SIMPLY
FOR CHARGING. THESE RADIO SOLD FOR $149.99 EACH IN STORES. ANTENNAS
ALSO SCREW OFF SO BETWEEN THE ANTENNA'S AND BATTERY PACKS THESE PACK
EASILY IN CAMPING GEAR. RADIOS HAVE A 5+ MILE RANGE AND WORK
AWESOME, ALSO THE BELT HOLDERS SLIDE ON AND OFF FOR EASY REMOVAL.
THESE RADIOS HAVE A SILENT MODE AND OF COARSE SQUELCH AND VOLUME
CONTROL, THEY ALSO HAVE HEADSET JACKS!

-38 QUITE-TONE CTCSS
-8.4V 1300mAH NiMH BATTERY PACK
-HIGH/LOW POWER LEVELS-1/5WATTS
-ANTENNA WITH BNC CONNECTORS
-WATER RESISTANCE
-WEATHER CHANNEL/WEATHER ALERT
-DUAL WATCH
-AUTO POWER OFF
-KEY LOCK
-COURTESY TONE

WITH EXTRA'S AND MUCH MORE....
ASKING 100.00 FOR THE PAIR OR MAKE OFFER!

I honestly enjoy listening to people with questions or problems with their equipment and the such... But having rat shack tell us that this radio, made for GMRS, can go 5+ miles?

I hate it when people are bought into advertisements. 5 watts or not, unless you're in the sahara desert, it will never go 5+ miles. Sure if you're on a mountain top, but normally most people living in the US don't own a mountain top to try.

Redfox:
Have you ever used these radios, or are you trying to sell them "new"? What is the exact range of the radios, not the advertised range.

I appreciate that you wrote to us on here to sell your radio, but if you can include more accurate information, that would be great. Most bubblepack radios (whether radio shack or not) with a rating of 5 watts, only tend to go no farther than 1 mile in the city, maybe 2 on the highway, but in all the years that I've used GMRS on 5w, have never seen it go more than 2 miles. Unless you're using a repeater, which may have a pre-amp and receiving system of some kind.

If I sound "off it" or seem rude, I'm not really, nor am I really this way in general. But waking up after a long sleepless night could make a person sound that way. =c) I wish you the best luck and hope that you do sell your radio. There's also a group on yahoo that deals specifically with equipment offered for sale or that is wanted (radios4sale). I'd try there as well.

Now if you have any questions on why a 5w radio would only go 2 miles, then we would be happy to help you as well...

Perhaps but perhaps not.
Last week I spoke with a gentlemen who has a FRS/GMRS HT and he was bragging he could hear our "Traffic Watch" operators even from the next county over and that's over 20 miles. He understood that his 5-mile radio was working up to and in excess of 20 miles and was very pleased it was working so well.
Well, er, when you are monitoring a repeater I suppose he would be pleased.

Topic: 10125 Message: 10128

The 19-903 is a "commercial grade" Rat Shack HT. I've got one. Supposedly it is 5 watt, and with a little bit of elevation and similar radio at the other end you probably could communicate at 5 miles. In the flats it is always dependent on terrain, intermod, user error, etc. etc. In the mountains all bets are off; I have had a conversation mountain top to mountain top at 5+ miles with 1/2 watt cheapo MOT bubble pack radios.

If I had some extra cash and a few less HTs around the house I'd buy these.

Are these similar to the Icom GMRS radios.
My unit is changing over from the bubble packs to the Icoms and if this is similar, I might be interested.

Joe - which Icom??? If you mean the F21GM that is repeater capable, the answer is no.

Yes, the F21GM. We have two of these and communications are
outstanding on these compared to the bubble-pack radios.(even the
midland 5watt units are not very clear compared to the Icoms). I
noticed the antenna on the radio shack units was removable/replaceable
but it would be nice to know if the radio part had more in common with
the bubble-packs or the Icoms.

Topic: 10125 Message: 10132

Joe - The F21GM has been a steady seller (until the F4TR came along last month) and is like comparing apples with oranges to consider it similar to simplex FRS/GMRS handhelds. You have obviously noticed this.

Just an aside - it would not be surprising to see Radio Shack's focus on two-way radios diminish considerably in the near future, as it already has on scanners. One store last week only had two scanners on hand, and now apparently the word from Ft. Worth is no more books are to be stocked - including Police Call that has been published for 42 years. A person has to wonder if "Radio" in the RS name is going obsolete in favor of "Cellphone Shack" or "Game Shack". Follow the money.

Well, I guess you can't blame them for wanting to make a buck. They must know their business but I can see a change of name coming. I personally don't know of anyone under 40 who works on electronics on a component level which was their business when I was younger. And with cell phones, who is buying two way radios? I will have to checkout the F4TR. Thanks for the info
Joe

10134. Re: [GMRS] Radio Shack 19-903 GMRS HT's

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-29 00:10:33 UTC
From: Maire-Radios
Topic: 10125 Message: 10134

look at the F43GT the TR is the trunk verison
we can sell both and the GT is the one we sell the most of.

From: Joe
Topic: 10125 Message: 10136

Who in their right mind would call anything from TrashShack
"Commercial grade"?
This is more of the tired junk that they have been trying to make a
buck on for years I have never had any luck except the old crystal
maxons they sold. Those were good radios I think only 2 watts though.
I use Motorola in my work and own an HT1000 that is a commercial grade
radio.

10137. RE: [GMRS] Re: Radio Shack 19-903 GMRS HT's

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-29 05:04:13 UTC
From: Leef R.K.
Topic: 10125 Message: 10137

A strong point of the Icom F4TR is that you can program it for up to 250 conventional channels instead of trunking. Another is the F4TR at $179 (or $199 with upgraded battery and rapid charger) makes it a super best buy.

Bob

10138. Re: [GMRS] Re: Radio Shack 19-903 GMRS HT's

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-29 06:37:14 UTC
From: Mathew Quaife
Topic: 10125 Message: 10138

Joe, i just have to jump in here and defend TrashShack as you call it. First you mention they sale junk, and that they make a buck off of it, then you say you only use Motorola. Guess who made most of Radioshacks radio's in the comercial side of it... Yep Motorola. Like all other's, Radioshack built some bad radios, so did Motorola... But then you get what you pay for. You can't blame this guy for making an attempt to recoup some of his money. I've been with Radioshack for better than 22 years. And yes, Radioshack will make some changes. And there is more than two scanners, actually they have the best buy on scanners. WHy buy a book, when you can get it all free on the web. Aside of all that Radioshack has done wrong, they like anyone else makes bad decisions, but they do stand behind thier product. Get that at Bestbuy! You won't.

Don't want to start a war here either, do dont' please. I serviced commericial radios for better than five years, as well as a tv/radio repairman, and all the companies had good and bad.

Mathew

Joe <olderookie@...> wrote:

Who in their right mind would call anything from TrashShack
"Commercial grade"?
This is more of the tired junk that they have been trying to make a
buck on for years I have never had any luck except the old crystal
maxons they sold. Those were good radios I think only 2 watts though.
I use Motorola in my work and own an HT1000 that is a commercial grade
radio.

Yea, I remember when they were mail order only (at least in my part of the woods) and they were called Allied Radio Shack...had a catalog about an inch thick and sold everything and I mean everything!

Bob, GMRS WPVV845, Amateur KG4WAD, LMRS WPXC892

Joe,

One mans Trash may be another mans Treasure. That holds very true in radio.

I have an ICOM IC-F4GS with battery charger available, nearly new. Used as a monitor receiver for a short time, it has less than an hour transmit time on it and has never been out of our non-smoking house. Absolutely clean, no marks on it anywhere.

$160 includes shipping within the US via USPS Priority Mail. Payment via USPS money order only.

10143. Communications with Katrina

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-30 22:02:13 UTC
From: kvsp1160@aol.com
Topic: 10143 Message: 10143

Hi everyone,

I wanted to check in to see how everyone is holding up with the hurricane. I have a few questions for those who were affected, as well as other who just want to share as well:

- Anyone used GMRS during this storm for emergency or family-related communications?
- How has this situation been handled?
- Did you save any lives or prevent futher damage to others while using GMRS systems?
- Any other thoughts or stories that you would like to share?

Hope everyone is (and stays) safe, and I look forward to your answers and stories.

Take care and 73's,
Ryan

Hey,

Just wanted to say Pensacola, where I am, was blessed with only catching the east end of Katrina. High winds, some rain, minor flooding, and minimum damage.

May God bless us all in this time of national disaster.

73,
Paul, KK4VG / WQBW873

10145. Re: Radio Shack 19-903 GMRS HT's

Yahoo group: GMRS (2005 — 2007)
Date: 2005-08-30 23:08:16 UTC
From: petey_racer
Topic: 10125 Message: 10145

Well, since I am the one who bought these radios from redfox I kind of
feel the need to comment. I did some research before commiting to buy
them. I already have several pairs of radios (including some top of
the line Cobra bubble packs) but wanted something better. I have a
pair of good Motorola business radios also, which are part 90 & 95
approved for GMRS, but they are featureless.
I found out that these RS radios are very well made and were regarded
highly before RS discontinued them. From what I read most all who were
actually able to buy a set of these were very happy with them. The
only drawback I can see is that they are not repeater capable. This is
fine with me as there are none around me and I have no intention of
putting one up.
They do have detachable BNC antennas and are a TRUE 5 watts.

From: Reed Andrew
Topic: 10125 Message: 10146

Besides the hand held radios, are there portables or base type radios?

Andrew

kvsp1160@... wrote:
I honestly enjoy listening to people with questions or problems with their equipment and the such... But having rat shack tell us that this radio, made for GMRS, can go 5+ miles?

I hate it when people are bought into advertisements. 5 watts or not, unless you're in the sahara desert, it will never go 5+ miles. Sure if you're on a mountain top, but normally most people living in the US don't own a mountain top to try.

Redfox:
Have you ever used these radios, or are you trying to sell them "new"? What is the exact range of the radios, not the advertised range.

I appreciate that you wrote to us on here to sell your radio, but if you can include more accurate information, that would be great. Most bubblepack radios (whether radio shack or not) with a rating of 5 watts, only tend to go no farther than 1 mile in the city, maybe 2 on the highway, but in all the years that I've used GMRS on 5w, have never seen it go more than 2 miles. Unless you're using a repeater, which may have a pre-amp and receiving system of some kind.

If I sound "off it" or seem rude, I'm not really, nor am I really this way in general. But waking up after a long sleepless night could make a person sound that way. =c) I wish you the best luck and hope that you do sell your radio. There's also a group on yahoo that deals specifically with equipment offered for sale or that is wanted (radios4sale). I'd try there as well.

Now if you have any questions on why a 5w radio would only go 2 miles, then we would be happy to help you as well...

Topic: 10125 Message: 10147

Sure there are. Icom, Kenwood, Motorola, and Ritron all make great mobile radios that fall under Part 95.

As for Base radios, there is one company, called Audiovox, that makes a base GMRS/FRS/WX (weather) radio, but does not allow the user to TX on duplex frequencies for GMRS.

Most people use mobile units and add a power amp to boost their signals to 50w TPO (transmitting power output) and then add a base antenna to their system. I have a system that's portable, which uses a mobile Icom FR-21-460, a 35 watt power amp, and a Hustler G6-462-3 base antenna (3dB gain). I also have a tripod and masts to add extra height to the antenna. For coax, I use RG-8 and run no more than 50 feet, or RG-58 at 25 feet.

Depends on what application you use with your system, there are a wide variety of equipment and arrangements that are available for the licensed user for GMRS.

Did I cover it all? As for prices, it ranges widely from $85 to well over $1500, but again depends upon the applications, arrangements, and type of equipment.

Add to the list Midland's Olympian Series of mobiles. The MO-4032 will be an especially good one when it comes out this month (finally). with 32 channels, 45 watts, and MANY user programmable features at $289.

Bob

I assume this type announcement is allowed since I don't find any statement to the contrary.

New Quick charger SD-911 by Pryme Radio Products. Works on AT200, AT201, AT400, AT401, AT600, PR222, PR46, PR160, and PR460. Our price was $63. Some of these handhelds have been discontinued for two years or more (unfortunately) and are reaching the point of needing a new battery. So, here's the deal: SD-911 Quick Charger ($63) and new NiMH battery ($63) both for only $84.50 including shipping/handling FedEx Ground except Alaska and Hawaii. Very limited stock on hand.

10151. bubble pack question

Yahoo group: GMRS (2005 — 2007)

From: alexolog
Topic: 10151 Message: 10151

Hello people,

I have a question regarding "bubble pack" radios.
I hope it is the right forum. If not, please forgive me.

First, some background:

I live in Canada.
GMRS has been recently deregulated here so FRS/GMRS radios are
getting quite popular. The extra range over plain FRS is very useful.

I got some Midland G-227 units some time ago and they gave me a lot
of grief. Every little bump would cause them to go out of sync and I
had to spend more time disassembling them and screwing around with
the frequency tuning screw than actually using them.

So, could you please recommend better units?

I'd like them to have good range, decent battery life (I prefer to
use regular NiMH rechargeables, in fact I already have 12 AAA that I
used in the Midland radios) and to be reasonably kid proof (that is,
withstand a fall from 1m on asphalt).

Thank you in advance,
Alex.

Hello,

I Think you can't go wrong with the Motorola's they are far more reliable and better built product.

getting quite popular. The extra range over plain FRS is very useful.

I got some Midland G-227 units some time ago and they gave me a lot
of grief. Every little bump would cause them to go out of sync and I
had to spend more time disassembling them and screwing around with
the frequency tuning screw than actually using them.

So, could you please recommend better units?

I'd like them to have good range, decent battery life (I prefer to
use regular NiMH rechargeables, in fact I already have 12 AAA that I
used in the Midland radios) and to be reasonably kid proof (that is,
withstand a fall from 1m on asphalt).

Thank you in advance,
Alex.

Just for general info: Most new Kenwood commercial handhelds and mobiles are type certified (accepted) for part 95 as well as part 90. Some already come preprogrammed with gmrs freq, tk-3101 etc. They are also repeater capable and are much better radio's than these damn bubble packs. They also can have an external antenna connected if you obtain the sma/bnc adapter. Check with your local 2-way shop!!!! And, the two-way shop should tell you that if the radio is capable of an external antenna that takes it out of the unlicensed FRS class and puts it into GMRS Part 95or 95a where it would require a license, or into a IG Business License for Part 90.

"Real" radios are great, much better than bubble packs.. IF you are in a car or tend to not go out with the radio for long periods of time. Else you get into the weight and expense of carrying extra battery packs.

If you take the radio out for all-weekend or even all week it is much more practical to have a radio that uses 4 x AA and is light weight even if the performance is not quite the same as a commercial radio. I have a pair of "real" handheld radios, they have excellent range and sound quality, I love them, but the batteries are heavy and not cheap either. I use them if I am going car to car or out for just the day. Or in a situation where I am on a regular schedule that allows for recharging from available power. I tired to use them once when I was out camping for a week. It sucked.

For longer stints especially on foot, the T7200 "bubbles" are much better, I can carry the radios and two spare sets of batteries (will easily last all weekend) in my little camelbak and hardly notice it. So I still get a lot of use out of them. And the batteries are MUCH cheaper, obviously. You can get 4 sets of 2400 MAh NiMH AA's plus an 8 cell fast charger for less than the price of ONE typical radio battery pack. No they don't perform as well, but that has nothing to do with the batteries. It has a lot to do with the antenna... But anyway when you are out and about, having a radio that is not bogging you down, that you can leave ON because you're not worried at all about batteries.. that is a very big advantage. If you have to keep fidddling with your expensive radio and turning it off to save power then it's not really too pleasant.

Radio battery packs are basically a cash cow for radio manufacturers that no-one wants to kill. The reality is that with the fantastic NiMH battery capacity that is available now, AA's are a totally viable option for powering a quality radio. I wish someone would just make one.

-Ben

From: elviejo4570
Topic: 10157 Message: 10157

Hi Guys,
Please excuse a dumb question, but...I have been thinking about getting a gmrs handheld radio, but don't quite now which one to buy. A fellow at work has a handheld radio that is 2m/440. The frequency dial adjusts to 462.550 to 467.725 in .025 steps. My question is can this radio talk to gmrs units? Thanks for any input.

In many cases the radio will tune and receive on frequencies that it will not transmit on unless the unit is modified. Otherwise if it will tune the frequency and transmit then it will talk to the GMRS. If it is not type accepted by the fcc then it is against regs to use it on the GMRS channels though many do. If you don't plan to get the licencse then the bubble pack radios are definitly the way to go.

Yes.

GMRS users are authorized to use higher power (5 watts compared to 0.5 watt) and can use higher-gain antennas on the shared channels.

On the "22 channel" radios, the only channels which can be used without a license are the 7 FRS-only channels.

To use ANY GMRS channels on high power (if selectable or not) requires
a license.
With no license, just stay off 1-7 & 15-22, or make sure the radio is
set to low power on 1-7.
Best bet is the just get your GMRS license. It's real easy and the
peace of mind is nice.

I think the question was misunderstood when this answer was given. The person asking mentioned "for GMRS/FRS combined unit" and referred to "those 7 shared channels". A GMRS license would of course be required (to transmit) on "those 7 shared channels" if the user had a FRS/GMRS radio. It would not be required if the user had a FRS radio.

From: Leef R.K.
Topic: 10158 Message: 10167

And, do any of the FRS/GMRS radios actually have "reduced power" (to 1/2) watt on shared channels 1 through 7? Even if they did, who would want to use less when "more" is "better"? Longer distance coverage is the name of the game for manufacturers. This is easily seen in their mostly unreasonable claims.

10169. Re: [GMRS] License for GMRS/FRS common channels.

Yahoo group: GMRS (2005 — 2007)
Date: 2005-09-06 20:15:02 UTC
From: Chris Catotti
Topic: 10158 Message: 10169

I have made several calls trying to the FCC trying to find out what I can and can not do with my GMRS license, and what my options when trying to plan emergency communications for my family and my Girl Scouts and Cub Scouts that I work with. As I discuss things, frequencies are all in MHz. Generally, the "blister pack" radios that have a fixed antenna, and typically 22 channels are dual GMRS/FRS. Recall that: 1. FRS shares seven channels with GMRS 2. FRS has seven unique FRS-Only channels On my Uniden blister-packs, channels 1-7 are the shared channels, they transmit greater than 500 milliwatt, the display includes an icon indicating high-power, requires a GMRS license to transmit on these channels, and are the following frequencies: 462.5625 462.5875 462.6125 462.6375 462.6625 462.6875 462.7125 On my Uniden blister-packs, channels 8-14 are FRS only channels, they transmit no more than 500 milliwatt, the display includes an icon indicating low-power, and requires no license to transmit, and are the following frequencies: 467.5625 467.5875 467.6125 467.6375 467.6625 467.6875 467.7125 On my Uniden blister-packs, channels 15-22 are GMRS-only channels, they transmit greater than 500 milliwatt, the display includes an icon indicating high-power, requires a GMRS license to transmit on these channels, are simplex-only, can listen to the eight repeater-output channels and are the following frequencies: 462.5500 462.5750 462.6000 462.6250 462.6500 462.6750 462.7000 462.7250 My ICOM IC-F21GM are GMRS-only radios. They require a GMRS license on any channel they transmit. The IC-F21GM gas 15 channels. All fifteen may be used in simplex mode, and eight of those are also capable of repeater operation (semi-duplex mode). The IC-F21GM channels 1 through 8 correspond to the Uniden blister-packs channels 15-22. The IC-F21GM channels 9 through 15 correspond to the Uniden blister-packs channels 15-22 Okay! So what? What can I conclude? 1. Blister-packs can be operated without a license on the seven FRS channels that are low power 467.5625 467.5875 467.6125 467.6375 467.6625 467.6875 467.7125 2. Blister-packs require a license on the seven FRS channels that are high power 462.5625 462.5875 462.6125 462.6375 462.6625 462.6875 462.7125 3. Blister-packs require a license on GMRS-only channels. 462.5500 462.5750 462.6000 462.6250 462.6500 462.6750 462.7000 462.7250 4. I assume that businesses may use FRS radios (500 milliwatt maximum) without a license. Therefore business may the seven FRS-only channels. Businesses may not use the other 7 FRS/GMRS channels unless they are using blister packs that ONY HAVE THE 14 FRS Channels. These are not commonly sold now. I can not be certain that a business (my favorite restaurants, hotels, and construction sites) are violating FCC rules unless I actually see the radio they are using. 5. Use of blister-packs on the upper channels (repeater output) always requires a GMRS license. 462.5500 462.5750 462.6000 462.6250 462.6500 462.6750 462.7000 462.7250 6. My family is covered by our GMRS license, but as a Scout leader, I do have some issues: A. If I provide Scouts with the current fleet of blister-packs, that have the rechargeable batteries include, they can only use them on the seven FRS-only channels (no-one else has paid the $80 license fee) B. My ICOM IC-F21GM is GMRS-only, and therefore cannot talk to the 22-channel blisterpack people on FRS channels, because the ICOM IC-F21GM does not have the 500 milliwatt FRS-only channels, and the Scout families do not have a GMRS license to use the shared FRS/GMRS channels. C. I would have to provide the Scouts with genuine FRS-only blister packs (has anyone seen 14 channel ones with a rechargeable battery included), or I must also carry a blister-pack radio with my ICOM IC-F21GM. PLEASE CORRECT ANY MISUNDERSTANDINGS I MAY HAVE. I AM TRYING TO GET IT RIGHT. Thanks! Chris Catotti WQCN791 KD4ACE -----Original Message----- From: "Leef R.K." Sent: Sep 6, 2005 1:02

PM To: GMRS@yahoogroups.com Subject: Re: [GMRS] License for GMRS/FRS common channels. And, do any of the FRS/GMRS radios actually have "reduced power" (to 1/2) watt on shared channels 1 through 7? Even if they did, who would want to use less when "more" is "better"? Longer distance coverage is the name of the game for manufacturers. This is easily seen in their mostly unreasonable claims.

Bob

you need a Lic for shared channels "IF" you are running higher pwr then the
FRS 1/2 watt and other then stock antenna

Yes. You have to set it that way though. Only on the FRS only
channels do radios automatically drop to low power.

Not legally. In order to legally transmit on GMRS, the radio must be
Part 95A accepted. Amateur radios are NOT type accepted for GMRS.

From: kvsp1160@aol.com
Topic: 10158 Message: 10175

Yes. In order to operate that specific unit (whether you'll be using the GMRS/FRS shared freqs or not), you need an FCC GMRS license. It's only $80, and will cover your entire immediate family for five years.

Hope that helps. 73's,
Ryan

My Cobra bubble pack radios will automatically drop to low on the FRS only chanels. The will go to high on the GMRS only chanels. The shared chanels will go to high with the option to switch to low.
I'm sure other brands are different but that's how my Cobra's work and thay are the only bubble pack GMRS radios I own.

Like has been said. If you use high power on the shared channels you need the license.

From: kvsp1160@aol.com
Topic: 10157 Message: 10177

Yes, you may if the radio is Part 95 type accepted.

Reply to JL's answer:
There are some amateur radios on the market that are both Type 90 and 95 accepted, which would be legal since GMRS requirements say that Part 95 units only may operate on GMRS frequencies.

However, if you are planning on cross-linking amateur rado with GMRS, that is NOT acceptable and is very much illegal.

I just figured if you wern't going to get the license then the best
thing for the rest of us would be if you had a junky little bubble
pack.

10179. PR-460 Help

Yahoo group: GMRS (2005 — 2007)
Date: 2005-09-07 00:07:16 UTC
From: kvsp1160@aol.com
Topic: 10179 Message: 10179

Hi Guys,

It has come to my attention that a few people need help with operating or programming their PR-460 radios.

I own two PR-460 and one PR-460-D radios, and they've been in use for over 3 years now. If you need help with the general operation of your unit, or how to program CTCSS or paging tones into your PR-460, please email me on the side. I'd be more than happy to help you in any way that I can.

73's,
Ryan

Chris,

Some time ago I too called the FCC for information on GMRS. Not one of the FCC people I spoke with (at the public info 800 line) knew what GMRS was (although they were all very familiar with Janet Jackson).

The bottom line is this -- if you use the GMRS only channels (channels 15 to 22 on a bubble pack radio) you need a license. Simplex or duplex (repeater) doesn't matter You need a license. No exception

If you use the FRS channels at 500mw or less you do not need a license. These are channels 1 to 14. 1 to 7 are shared with GMRS and 8 to 14 are FRS-only, but your radios will automatically switch to the lower FRS power on these channels, so you will stay legal. Just don't use channels 15 to 22 unless you pay for a license.

The safest best is to use only the FRS channels OR pay for a GMRS license.

Probably the only people at the FCC who can answer anything about GMRS are Bill Cross or Riley Hollingsworth. firstname.lastname@...

Recognize that each of them received 1,000 or 2,000 messages per day and go easy on them.

Try to answer the questions for yourself before you contact them.

Just about anything you need to know is on the Web (see links below my name).

Good luck!

From: Ronny Julian
Topic: 10158 Message: 10181

I AM getting the licence. I just don't plan to use anything made in
such a trashy manner.

10182. Re: [GMRS] License for GMRS/FRS common channels.

Yahoo group: GMRS (2005 — 2007)
Date: 2005-09-07 08:10:39 UTC
From: kvsp1160@aol.com
Topic: 10158 Message: 10182

Joe:
Maybe if you re-word you message next time, it won't seem rude to the other who originally asked the question. I know that you're getting fustrated with unlicensed people, but saying that "the best thing for the rest of us would be if you had a junky little bubble pack", wasn't the greatest way to express yourself...

Ronny:
It's not up to "us" to decide whether or not you want to get a bubble pack radio or a commercial-type radio. All we are concerned about is having more people on GMRS frequencies without an FCC license. It seems that more "bubble-pack" radios (that are on the market) don't have notices (or many) telling the consumer that an FCC license is required for that specific radio.

I want to apoligize for any misunderstandings that we may have had with you and your questions. I just wanted to inform you of how we felt, and were afraid that you were another "non-licensed" person.

I am, however, happy that you will be getting your license. I will be honored to talk with you on the air someday in the near future. If you have any other questions, please feel free to ask myself or the group. Good luck and 73's!

Ryan

From: petey_racer
Topic: 10158 Message: 10183

I'll have to agree with Ryan. He makes good points.

I will say, there is nothing wrong with GOOD bubble pak radios for general, local family use. My advice would be to only get a higher end set and research them well.
For instance, Uniden's "5 watt" GXT500 is in actuality ~1.5 watts, and their "4 watt" GXT400 is ~2 watts. Also, pay absolutely NO attention to mileage coverage claims.

Some homework and looking can land a decent set of radios.

If you are more serious, the sky's the limit.

Peter

10184. ham typo

Yahoo group: GMRS (2005 — 2007)
Date: 2005-09-07 14:28:45 UTC
From: Dominick
Topic: 10184 Message: 10184

Transtar scheduling phone is

713.881.3169 The others work too but try to use this one.

--
Houston Transtar
Amateur (Ham) Radio Room
146.960-(103.5)
713.881.3164 (3165 / 3166 /3167)

10185. Amateur radio operators are still needed!

Yahoo group: GMRS (2005 — 2007)
Date: 2005-09-07 14:21:26 UTC
From: Dominick
Topic: 10185 Message: 10185

Amateur radio operators are still needed to fill positions at

Transtar on Old Katy Road
AstroDomain
Geo R Brown

We only need one person at the GRB & Transtar but need 3-4 at the dome. Please call 713.281.3169 or call on the 146.96-(103.5) repeater to volunteer.

The FCC is the LAST people you want to ask questions about GMRS.
There are several instinces where people complained about certain
problems, and the result was a ruling that made things WORSE.

GMRS is such an insignificant speck on their radar of services, that
only a large organization, on the scale of the Amateur Radio Relay
League (for Hams) could get their attention to our problems/questions.

Most questions can be answered by READING the plain english parts of
the rules (posted in the Files section of this group), or by asking
questions here.

10187. Re: [GMRS] License for GMRS/FRS common channels.

Yahoo group: GMRS (2005 — 2007)
Date: 2005-09-07 20:11:06 UTC
From: Chris Catotti
Topic: 10158 Message: 10187

I do understand ... I have a GMRS License, WQCN791. I saw an incorrect answer to the "Shared FRS" question. When using a blister pack radio such as the Uniden family of radios, you must have a GMRS license when transmitting on the shared channels (1 to 7 on a Uniden), because RF Power exceeds 500 mW, and this is indicated on the Uniden by an icon that shows a dark "filled" radio. The FRS-only channels (8 to 14 on a Uniden), do not require a license, as the are 500 mW or less and this is indicated on the Uniden by an icon that shows a light "hollow" radio. You are correct, on the Uniden channels 15 to 22 are GMRS-only, not just due to the power level, but also the frequencies are GMRS-only. 73 Chris WQCN791 KD4ACE -----Original Message----- From: Lake Hodges Radio Sent: Sep 6, 2005 8:25 PM To: GMRS@yahoogroups.com Subject: [GMRS] License for GMRS/FRS common channels. At 01:15 PM 09/06/2005, Chris Catotti wrote:

Chris,

Some time ago I too called the FCC for information on GMRS. Not one of the FCC people I spoke with (at the public info 800 line) knew what GMRS was (although they were all very familiar with Janet Jackson).

The bottom line is this -- if you use the GMRS only channels (channels 15 to 22 on a bubble pack radio) you need a license. Simplex or duplex (repeater) doesn't matter You need a license. No exception

If you use the FRS channels at 500mw or less you do not need a license. These are channels 1 to 14. 1 to 7 are shared with GMRS and 8 to 14 are FRS-only, but your radios will automatically switch to the lower FRS power on these channels, so you will stay legal. Just don't use channels 15 to 22 unless you pay for a license.

The safest best is to use only the FRS channels OR pay for a GMRS license.

Probably the only people at the FCC who can answer anything about GMRS are Bill Cross or Riley Hollingsworth. firstname.lastname@fcc.gov

Recognize that each of them received 1,000 or 2,000 messages per day and go easy on them.

Try to answer the questions for yourself before you contact them.

Just about anything you need to know is on the Web (see links below my name).

Good luck!

Subject: [BVARC] Astro Alert: Intense Solar Flare Prompts Warnings

A rare X10 solar flare has erupted from the Sun. If it persists, it could significantly affect radio communications and power grids around the globe.

==========
This Is SKY & TELESCOPE's AstroAlert for Sun-Earth Interactions
==========

A s t r o A l e r t

07 September 2005

Solar Terrestrial Dispatch
www.spacew.com

INTENSE SOLAR FLARE PROMPTS WARNINGS

A very strong class X17.1 solar flare exploded on the Sun at 17:40 UTC
(1:40 pm EDT). This is a significant event. Very few solar flares ever reach
the X-class rating, and far fewer ever exceed an X10 level. Only a few solar
flares each solar cycle (a 10-year period) exceed an X10 rating. An X17 solar
flare is 17 times more intense in x-rays than a class X1.0 (which is, by
itself, a very energetic event). This particular event was strong enough to
saturate one of the x-ray sensors on the GOES spacecraft and very nearly
saturated both sensors. This intense solar flare was visible in white-

light
by observers at Holloman solar observatory in New Mexico.

This event was associated with intense radio emissions and a
strong
high-velocity coronal mass ejection that was ejected well to the
southeast of
the Earth. Despite the poor location of this event, there is a chance
the
extreme western flanking edge of the associated shock wave may reach
the
Earth sometime on 9 September. Prior to that time, energetic protons
from the
solar flare may begin reaching the Earth and result in an increase in
the
radiation environment in the near-Earth space environment. Although no
significant geomagnetic or auroral storming is expected this time,
additional
possible major solar flares from this region during the next two
weeks could
easily provide the impetus for very strong space weather storms.

The sunspot complex responsible for this event is an
old "friend," by
the name of Region 10798, which was responsible for producing periods
of
severe geomagnetic storming last month. It's longevity is impressive,
as most
sunspot groups do not survive this long. As it came into view, NOAA
assigned
a new number to this region. It will hereafter be known as Region
10808 (nick
named Region 808).

The fact that this region has produced such a powerful flare
suggests
that it contains a complex magnetic topology. It is just now coming
into view
around the eastern limb of the Sun and is still too close to the limb
to
discern any significant detail. We expect additional major flares and
possibly additional significant major flares of X10 or greater
intensities,
during the next week.

Region 808 will gradually rotate across the solar disk during
the next
two weeks. During that time, if it retains its volatility, it may
produce
some serious effects at the Earth. The health of spacecraft may be
compromised if additional extreme events are observed. Power grids

may suffer
from induced currents caused by intense geomagnetic storms. Radio
communications may suffer from strong scintillation and absorption.
And large
regions of the Earth may be able to spot periods of auroral activity
("northern lights"). Region 808 will be best positioned to inflict
strong
impacts on the Earth in approximately another 4 to 5 days, with
maximal
effects possible from roughly 11 September through 18 September.
Spacecraft
will remain vulnerable to potential strong space radiation storms
through to
about 23 September.

It is perhaps produnt to note that these strong solar flares
pose no
known significant health threat to humans on the Earth. There is a
greater
threat to human health for astronauts on the International Space
Station, but
even they are relatively well protected in the heavily shielded
regions of
the space station. The combined effects of the Earth's magnetic field
and the
ionosphere protect human activities on Earth. However, some sensitive
industries on the ground can be adversely effected, including
electrical
power generation facilities, ionospheric radio communications,
satellite
communications, cellular phone networks, sensitive fabrication
industries,
and others. During the next two weeks, these industries may see an
increase
in anomalous incidents that may be attributed to space weather
effects.

From: kvsp1160@aol.com
Topic: 5259 Message: 10190

Hi Guys,

I was looking over our repeater database, and there aren't too many systems in CA or WA. Does anyone have any systems that are open to the public, or for membership? I'm trying to find more coverage for the San Jose/San Mateo, CA areas as well as the Seattle/Snohomish, WA areas.

Many thanks in advance. 73,
Ryan

I'd get the ID stopped as soon as possible. IDing of an unused
machine is "frequency camping" and is in violation of FCC regs.

I don't know where he found it but Nextel and others have been doing it for years.

There are towers there that ID only that Nextel have or had that have no other service on them but the ID units. Some of them were special made for them by E F Johnson .

95.795: Channel sharing.

(a) Channels or channel pairs (one 462 MHz frequency listed in 95.29(a) of this part and one 467 MHz frequency listed in 95.29(b) of this part) are available to GMRS systems only on a shared basis and will not be assigned for the exclusive use of any licensee. All station operators and GMRS system licensees must cooperate in the selection and use of channels to reduce interference and to make the most effective use of the facilities.

(b) Licensees of GMRS systems suffering or causing harmful interference are expected to cooperate and resolve this problem by mutually satisfactory arrangements. If the licensees are unable to do so, the FCC may impose restrictions including specifying the transmitter power, antenna height, or area or hours of operation of the stations concerned. Further, the use of any frequency at a given geographical location may be denied when, in the judgment of the FCC, its use in that location is not in the public interest; the use of any channel or channel pair may be restricted as to specified geographical areas, maximum power, or other operating conditions (see 95.71(d)).

PRA is filing complaints against repeater owners who have their stations ID set in "beacon" mode. Repeaters constantly IDing are in effect violating subsection (b) of this regulation. The FCC concurs.

GMRS repeaters are not required to ID. They MAY ID if there is traffic on the system. The ID must stop if the system is unused after the proper interval.

I don't read that into the info, but tonight I will get out the full set of part 95 and read it all. I know most of our repeater ID as we were told by the local FCC office years ago in letter form we had to do that. And since we can not count on the users to ID it is set up for the repeater to do it. The same is true for our HAM repeater and leased repeaters.

thanks and I will check it.

This repeater that is IDing the same freg as a repeater we had on the air since 1992 and before that is was a community repeater. (by an other co) . I know of no other in the area on the freg but if there is after the test I will be happy to remove it. I will make it to the tower sometime this week and handle it.

10203. Re: [GMRS] Tampa Bay Area Florida

Yahoo group: GMRS (2005 — 2007)
Date: 2005-09-12 22:48:36 UTC
From: kvsp1160@aol.com
Topic: 10195 Message: 10203

Which doesn't make any sense. Over the years through this group, and with the FCC rules, a repeater on the GMRS system has the option to ID every 15 minutes. Also, the persons on that repeater must ID every 15 minutes and then clear their callsign at the end of the transmission.

95.119 Station identification.

(a) Except as provided in paragraph (e), every GMRS station must transmit a station identification:

(1) Following the transmission of communications or a series of communications; and

(2) Every 15 minutes during a long transmission.

(b) The station identification is the call sign assigned to the GMRS station or system.

(c) A unit number may be included after the call sign in the identification.

(d) The station identification must be transmitted in:

(1) Voice in the English language; or

(2) International Morse code telegraphy.

(e) A station need not identify its transmissions if it automatically retransmits communications from another station which are properly identified.

So why is it illegal or wrong for a repeater to TX it's ID every 15 minutes? Yes, if it ID's while a physical person is transmitting, then that would be wrong. But when no physical persons are transmitting, then it's very much legal.

However, if a repeater that ID's every 15 minutes to "keep it's frequency" without any transmissions during a long period of time (not in use or service), then that also is illegal.

We have a few here in my area that are parking their repeaters on a freqency, and have used all of the PL tones for their use. But no one uses the repeater, except for practices; which are rare.

I'd love to have that frequency back (462.675). 73!

I think using the term "illegal" might be being confused with
impractical or unecessary.

We are all supposed to share the spectrum, which those who employ
EVERY PL and/or ID every 15 minutes are not practicing the spirit of
the service and rather simply causing interference.

According to the general practice of GMRS, one is supposed to monitor
before transmitting to make sure the frequency is clear. Of course,
it is difficult for a repeater to do this iteslf, thus the incessant
ID every 15 minutes is again simply causing interference.

Likewise, those who employ every PL known to man on their repeaters are begging for it to be tampered with, interfered with, etc. Its just simply not necessary. They are just asking for trouble and should another person set a repeater up on that same frequency, someone is going to have to give. Whether or not "I was there first", if you have your repeater in CSQ or every PL employed, if it gets far enough, you may be asked to decrease the amount of PL used.

In truth, there are no specific clear-cut rules prohibiting a repeater from ID'ing. However, it is insinuated with the monitor before transmit rule and general sharing practice. The FCC will be the judge. If this is occuring, make a complaint. The FCC can do nothing until they recieve complaints.

There are many repeaters which ID incessantly. I have heard a plethora pf them, and in some circles, these folkd have been dubbed "Frequency Campers". I'm sure this issue will be dealt with in the future and their day will come.

Hi Bob,
Yeah, I realized that after I hit the send button. I have been looking at the Icom f21gm and the f221s uhf radios. What I was looking for was an opinion on both of these units. Thanks again.

The F21GM is specifically for GMRS. You cannot put any other frequencies in it. I prefer the F4TR with coverage all the way from 440 to 490 mHz. and 250 channels. At $179 it is a super good buy.

The F221 is not FCC certified for Part 95/95A (GMRS). The one that I am waiting to install in my car is the new Midland MO-4032 due out this month. It has 32 channels and 45 watts for $289 with lots of user programmable features from the front panel. Covers 430 to 470 mHz. and is FCC certifed for Part 90 and Part 95A. It also qualifies technically for base operation.

Joe,
We have been using the F21GM's in our dog training for a couple of months. Nice and clear and much better distance than the 1 watt bubble pack's. One HT was flipped across the aluminum floor of our search boat repeatedly while we tried to start the outboard a few weeks ago and it showed no ill effects from the ordeal. Good solid units.

Hi guys,

I've been hearing alot about people referemcing radios to Part 95A. Is there a 95B? And is there a difference between 95 and 95A/B?

Never even knew that a 95A existed, at least not on the FCC rules & regs site.

It appears that Yahoo allows Yahoo members to spam their mailing list without moderation. Usually, the spammers get blocked by me by the dozen every day. But when Yahoo makes the decision to allow the posts without moderation, I can't do much about it.

What I can do is ban the spam posters and those who responded to it in the mialing list. This has been done. Needless to say, responding to spam in the mailing list is also spam and unwanted.

Thanks to the ones who brought it to my attention via direct e-mail.

Hi,

I'm looking for information on the Rechargeable Battery Packs used in the Genex GMRS MK2000.

Mainly want to know of the two contacts found on the back of the radio which is the positive and negative.

Exactly. That's what we do on our GMRS group. New members are moderated for at least a few times (or longer), and then our moderators set them to unmoderated...

Great way to deal with unwanted ads and spammers. Also a great way to deal with "loud-mouth" and "angry" members who are just there to cause trouble.

Hey,

I have that Radio also, I bought it at Radio Shack. I bought the last one and I need more. If you find any more let me know off the list. I have alkaline batteries in mine. There must be something missing when you use a charger. Let me know what you find out.

Thanks

Thank you for allowing my membership. I am a very recent licensee of GMRS (call is WQDE887). I am a resident of San Diego city and I understand there is one repeater on mount palomar for GMRS. I would like to know the rules and whatever to use the service properly. I am a long time amateur radio operator holding an extra class call of N6OPH. Any assistance would be welcome.

Thanks

10244. GE Mastr Exec II

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-07 02:39:46 UTC
From: kvsp1160@aol.com
Topic: 10244 Message: 10244

Hi guys,

Just bought a GE Mastr Exec II base transmitter on eBay. From my understanding, there is no duplexer in this unit. However, there is only one PL-259 connector on the back which makes me think that there is a duplexer installed. Second, the frequency is in the amateur bands and I need to replace the crystals. Any idea how to do this?

Here's the info for the unit that I found on the bottom:

COMB: F155KFU89A
SERIAL: 9120773
FCC TX: KT-125-A
FCC RX: ER-90-A

INPUT: 121 VAC
AMPS: 103
WATTS: 360
CYCLE: 50/60 HZ

FREQ RANGE: 440-470 MHz

OTHER: D C 147 842

Any information about this unit would be most grateful. Also, if you have a copy of the owners/service manual, I'll be happy to have one as well. I am reading the info on the repeater-builder website to help with my building...

if it is a base it would only have one connector. if it is a repeater it may have 2 one TX and one rx or just one connector if as you say it has a duplixer.

10246. Re: radio opinion

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-10 01:05:34 UTC
From: Richard Hayman
Topic: 10206 Message: 10246

I had a pair of them and sold 'em for less than half of what I paid for them. The DCS was very poor. It didn't always squelch the noise. The radio has little flexibilty compared to Midland 75-440 which I feel is the best radio for the money as long as you buy the programming software.

The ICOM comes with a small capacity battery pack. If you get the "AA" battery case, you need to short the limit switch to get 4 watts out. I also felt they were somewhat insensitive on receive. You can't easily switch between duplex and simplex on the same channel.

The best thing about them is the size and how they feel in your hand. The Midland is large but IMO a better radio.

Hi All!

You must get this question a lot:

What would you recommend for a 45/50 Watt GMRS capable Mobile Rig?

I've been tossing around the idea of getting the Icom IC-F221, which
covers 440□490MHz

http://www.icomamerica.com/land_mobile/mobileuhf/icf221main.asp

But I'm not sure how it "fits" in with the GMRS License Class,

Does anyone have any advice? Or a Link to a list of nice radios that
are legal for GMRS use?

Thanks!

From: m51f08
Topic: 10249 Message: 10249

Hello Folks,

I have a Maxon 210 + 3 that was working fine until yesterday. When turned on, the digital display is frozen for about 2 minutes, then it starts to operate normally. I reset the unit, checked inside the case for any obvious problems, checked battery voltage, but no luck. Anyone had this problem?

Thanks very much.

Mario, KAF5755

Hi James,

Glad to hear about your interest in GMRS. There are alot of mobiles that can be used for GMRS. Whether it's a search on eBay for new or used gear (keyword: uhf mobile, uhf radio, gmrs), to buy them at a ham radio swap meet, or at a store. Many people disreguard the fact that all GMRS radios have to meet the FCC Type 95 requirements, while others stand firm to the rules for their own personal use. It's up to you, but I'd suggest to follow those rules or at least try to find a radio that meets or exceeds Part 95.

The Icom radio is a good choice as it is user programmable for most of their radios. There are other manufacturers such as Kenwood, Midland, Motorola, etc. However it's up to the user to decide what's best for his needs.

Also, do you have a GMRS license? Getting one is easy. If you don't have one already and are aquiring these radios, many people in the GMRS community frown greatly upon this. If you do, then welcome!

Although I don't have much knowledge or recommendations for a mobile unit, this group has over 1,000 members that can be of assistance to help you in any way possible.

Good luck with your search and 73! (73=best wishes)

James, I would look at http://www.rkleef.com/ for good GMRS equipment. I would stay away from the icom stuff most of it is not Type acceptance. I wish Icom would spend the money and make them type acceptance they make good equipment. Also check out www.Popularwireless.com for more INFO.

Hey Ryan

I registered and paid for the application a couple of days ago at the FCC website. I'm waiting for the application to finish being "processed"

I just find the FCC website a pain to browse and look up radios for their compliance...

I'd recommend keeping an eye on the rules:

http://wireless.fcc.gov/services/personal/generalmobile/

http://wireless.fcc.gov/services/personal/generalmobile/data/bandplan.html

* Any mobile station or small base station in a GMRS system operating
in the simplex mode may transmit voice type emissions with no more than 5
watts ERP.

And have fun! GMRS 5 Watt is pretty good reach locally. On a good day I have
seen 15mi. Usually easy 5mi in my semi-flatland area.

-Ernie

From: kvsp1160@aol.com
Topic: 10247 Message: 10256

Ernie,

I'm sorry, but you have misquoted the rules. The 5 watts ERP pertains to a small base station...

Here's what the FCC says about power. And it's very clear of what power you may use for GMRS:

[Code of Federal Regulations]
[Title 47, Volume 5]
[Revised as of October 1, 2004]
From the U.S. Government Printing Office via GPO Access
[CITE: 47CFR95.135]

[Page 529]

TITLE 47--TELECOMMUNICATION

CHAPTER I--FEDERAL COMMUNICATIONS
COMMISSION (CONTINUED)

PART 95_PERSONAL RADIO SERVICES--Table of Contents

Subpart A_General Mobile Radio Service (GMRS)

Sec. 95.135 Maximum authorized transmitting power.

(a) No station may transmit with more than 50 watts output power.
(b) [Reserved]
(c) A small control station at a point north of Line A or east of Line C must transmit with no more than 5 watts ERP.
(d) A fixed station must transmit with no more than 15 watts output power.
(e) A small base station must transmit with no more than 5 watts ERP.

[48 FR 35237, Aug. 3, 1983, as amended at 53 FR 47717, Nov. 25, 1988; 63 FR 68975, Dec. 14, 1998]

Since a mobile or handheld is NOT a fixed or base station, it may transmit a MAXIMUM of 50 watts transmitting power output (TPO). A base radio or base station would be a system that does not move and has a license for a single (or multiple) frequency at a specific location; therfore it is a fixed station. Mobile's and HT's are allowed to move, are licensed to operate on the 16 GMRS frequencies, and is licensed to a single person or immediate family.

GMRS/FRS shared frequencies (channels 1-7 on FRS/GMRS radios) are allowed a maximum of 5 watts, with a detachable antenna. A FRS/GMRS radio with the same

ch 1-7, are allowed a maximum of 1 watt, with a fixed or non-removable antenna.

So overall, yes you may transmit up to 50 watts using a handheld (HT) or mobile radio. Repeaters may also transmit up to 50 watts, and they do not qualify as a fixed station (ask more on a different subject).

Sounds good!

So you know about your temporary license til you receive your official GMRS license? It's valid up to 90 days while your license is being processed... I think it's Schedule F of the 605 form on the FCC site. Download the PDF file, fill out the info, and keep it with you at your station until your official GMRS license arrives in the mail.

Hey James, the FCC appreciates your (Canadian)
dollars. However, aren't you covered by Industry
Canada rules? Last I heard, the FCC does not have
jurisdiction north of the US border although there is
much cooperation between the two agencies, including
accepting license grants for certain types of
services. Amateur comes to mind.

Hey Kevin,

How can you tell that James is Canadian?

And ya, Canada doesn't allow GMRS just yet, but they are working on it. But haven't heard any new updates about it, so it might have changed... Amateur is another thought, but you'd have to study for the license, or take classes through the ARRL online or with your local amateur radio group. I'm getting mine by December! =c) Anyways...

I made the big assumption that Magill.CA is Magill College in Canada. And further assumed that being somehow associated with that fine institution, probably resides somewheres up there. All the assumes are mine realizing also that email addresses, like rf radiation, does not have political borders.

From: petey_racer
Topic: 10263 Message: 10263

I have tried to program my radio several different ways. I tried one channel per system. I tried one channel per group.
With no way I've done it can I get it to scan all the frequencies I have entered.
Can anyone give me some help as to something I am missing or doing wrong.
Thanks very much!

Peter

has to be per system not group. Then your add/del key has to be activated in your key assignment then your arrow on the display is for your scan list.
good luck,
Mike

I know that one "gotcha" with the radio is that by default, the microphone has to be "on hook" (i.e. the metal mic holder, and the holder has to be grounded) in order for scan to work (the rationale being that if you're "off hook" you're in a conversation and don't want to scan). I think there is an option in the software to allow off-hook scanning.

The TK-880 may be programmed either one frequency per system (or channel) or all frequencies in one system. It makes no difference how you do it if you go into the Scan tab and configure it correctly. There is a configuration feature in the scan tab to either scan systems or groups, it has to be configured in the software tailored to your specs.

Also, like someone said earlier, you have to configure the radio in the software to scan with the mic either on or off hook, which of course means when the mic is not grounded, it will not scan. That also is in the scan tab and can be set to scan either way.

Hope this helps!

10267. Looking for radios

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-21 03:38:52 UTC
From: wa7zbo
Topic: 10267 Message: 10267

I need to purchase 50 FRS radios for our community emergency communications system. These will be given out in 10 packages of 5 to volunteers living in our city. I thought it would not be that hard but the task is getting harder all the time. First I want people to be able to understand what's being said. I am totally disappointed in the Motorola "Talk about", they sound like mush! Second I want them to be FRS only so no one strays into GMRS County. Third I want them to run on AA alkaline batteries. It's been my experience that rechargeable batteries supply short life, but also fail at the wrong time. And forth they need to be cheap enough to be able to buy 50 to begin with. I realize this is a GMRS site, but it's also home of the most market smart people on this subject. Thanks for your help.

Larry,

I'll take a stab at your question, with some good info and replies...

First off, do not be fooled by the advertisements that FRS packages say about range. In a city like yours, (or San Jose, CA where I'm from) a FRS unit can transmit about a mile. Maybe more if lucky. Since FRS radios only transmit 0.5 watts (legal power per FCC), they are very efficient for close range applications.

I don't know if you want to cover part of the city, or the entire city/county... But FRS won't be your solution. Even though they are inexpensive (starting at $20 and up). If you have the funds and means to continue to have thorough coverage, this isn't a great way to have long-term use.

I'd suggest to use either business or GMRS radios. I understand the "fear" of non-licensed users on these types of systems, but $80 for 5 years for an entire family is a great deal. Plus you are able to set up a repeater that will guarantee coverage for your city. The radios may be a bit more expensive, but the results are exceptional and will last much longer than cheap FRS radios.

If you are still determined to use FRS radios, your communications will have to be repeated from person to person to get across a large span or area. I will still recommend Motorola, or Cobra for your FRS radios. Some models are cheaper and do sound poorly, while others are great to use and will meet your specific needs.

Now I'm just one member of a few thousand on this group, so don't jump to an answer until you've heard what our opinions are. And also don't be offended if a few on here get on your case about using FRS in the first place. I do agree that they're not the way to go, but will also support your request and try to help the best that I am/we are able to. And please feel free to expand your questions and keep asking until you get a satisfied answer. We're here to help people like you...

Hi Larry

Is this a CERT group?...Just curious.

My thought is to get an itenerant frequency business license...costs about $100 and you can get radios from radio shack and lowes hardware and such. Doesn't require coordination either. These radios will have the itenerant freqs already programmed in...you just select what you want by either dip switches or front panel programming. You can get VHF or UHF. You can set up base stations and run much higher power than FRS.

I agree with Ryan...FRS is NOT the way to go and I really doubt that you will find any FRS only radios...I could be wrong tho.

Just my thoughts.

Not to confuse the initial question, but another choice may be MURS. The new MURs radios are more expensive than FRS radios but no license required and not much interference from other users. Search the web for more MURS information, there is an active MURS Yahoo group as well.

MURs is VHF, limited to 2 watts, and generally works pretty good for small area/line of site simplex communications (generally a couple of miles coverage).

Hi Larry,
Cheap radios are exactly that.
I'm not sure that you will find a better radio
for audio or performance for the money of a Motorola.
Have you tried using a speaker mic with your Motorolas?
It might improve the audio (and be a little easier
on the pocketbook if you already have some Motorolas).

Icom has a new FRS radio, I haven't tried it yet:

http://www.universal-radio.com/catalog/frs/4088.html

Icom has a good reputation and I am loyal to their
ham equipment so I, personally, would expect good things
from this new radio.

I own and use the Midland GXT-400 radios and have no
complaints.

I agree with Rob. MURS is the way to go.

If you have ever looked at the FCC type acceptance forms for the FRS radios you'd be surprised at what you might find.

Take for instance the Uniden FRS radios I have. According to the TA paperwork, the radios DO put out 500 milliwatts, however due to their very inefficient antennas the ERP is only 130 milliwatts. Since the FRS radios have non-detachable antennas, and also their small size, you are lucky to get much power out.

Craig

Hi Larry,
Just came off an exercise that used a wide varity of gmrs/frs
radio equipment. Some worked very well, some did not, but one thing
I did notice was that we finally had to hold a class on the proper
way to speak/use a radio. It might be worthwhile to provide some
guidance for your group...we even taped some of the offenders to let
them hear how they sounded...yeah, like mush.

10275. GMRS operators can unite under Yahoo 360

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-21 21:10:46 UTC
From: John L. Wilkerson Jr.
Topic: 10275 Message: 10275

I'm a Yahoo user. I created a page on the new Yahoo 360, listing GMRS as an interest. You can create blogs and add friend lists.

This could be an important tool in uniting GMRS users. If everyone would add GMRS as an interest, we could spread the word on our service.

For those of you who know me, I am trying my darndest to get the word out that GMRS users are in fact a community.

Just an idea.

Here's the link for info:

http://360.yahoo.com/

Topic: 10267 Message: 10276

please don't by junk, if you do you will buy it over and over again. Over the years we sold Motorola, Maxon/Midland, EF Johnson, Vertex Kenwood and Icom radio's they all make radio's some better that others and others at the high end. Some of the people we sold low cost to had so much problems with there radio's they stop using radio's and went other ways and you ready don't do what you need or can count on the operation. Had the same thing with one of the groups we do they all went with Kenwood TK-380 radio's with chargers and a AA back up pack for each radio. Put them on one of our repeater and they get about a 20 mile range out of there radio's. They also have talk around and a simplex channel we give them to use. Cost for all radio's to use the system $50.00 per month. No air time cost and the repeater has about 30 hours of battery on TX and a lot longer in stand by time.

If you want more info let me know.
thanks john

10278. Re: Looking for radios

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-21 23:48:26 UTC
From: wa7zbo
Topic: 10267 Message: 10278

Thank you all for your quick response. In detail here's what we are doing. We are setting up communications in small cells. There are six cells in our area of concern all within a 1 mile by 1 mile area. Each cell would by given 6 FRS radios with batteries in a storage case. Each cell is assigned 2 channels. Cell 1 = Ch.1 & Ch.7, Cell 2 = Ch.2 & Ch.8, Etc. Channels 13 & 14 would be left for special needs. Radios would be handed out to team leaders in charge of projects. (Medical, welfare, rescue, etc.) No communications in any cell would be more than 1/2 mile and in most cases only several blocks. Communications between the cells and command center will be on 2 meters simplex and out of the command center to the rest of the world on 2 meters, 70CM, and HF as needed.
As you can see there are many people involved and licensing them would be impossible. Besides the radios supplied, we would encourage the citizens to bring their own radios on line.
If you note what city I'm in you might understand that all the organization I've told you about is already in place just waiting for radios. After we coordinated 20,000 volunteers at the Winter Olympics in 2002, this should be a cake walk! 73 and thanks again.

Hi Alex,
Saw/heard a fairly large variety of gmrs handhelds. The old saw..."you get what you pay for" apparently is true with radios. The advertised range is a joke even with the disclaimer of "your milage may vary." In the field, the higher dollar units sounded better, had a stronger signal...more range. The Icom FT-1000 (think that is the model #...older radio) did very well. If I were looking at emergency type use, I would look at a unit with 4-5 watts with a removable antenna. The other big item is how people use the units. If the user is seated with the radio clipped to his belt or in a pocket using an earbud...no range whatsoever...line of sight = 2-3ft off the ground. Then there is the issue of not speaking clearly and distinctly...the mouth full of mush syndrome thru a cheap radio... might as well get out the string and tomato cans. Also, some of the units seemed to suffer from inadequate battery power...I would frequently have to ask the users to change batteries...signals just got very faint without a whole lot of TXing.

Joe

10285. Re: [GMRS] Fw: USING F-R-S CHANNEL 1 TO SUPPORT A NETWORK OF TRAINED VOLUNTEERS FOR NEIGHBORHOOD COMMUNICATIONS DURING A DISASTER OR EMERGENCY SITUATION

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-24 21:40:14 UTC
From: Chris Catotti
Topic: 10284 Message: 10285

I looked over the sugested PDF, and I have a question. I have looked at a lot of blister packs. They are sold at Radio Shack, K-mart, Walmart, Target, Office Max, Office Depot, etc. ALL of the ones I have seen at the above retailers are 22-Channel dual GMRS and FRS, with Channels 1-7 taking advantage of the higher power limit, and channels 8-14 using strictly 500 mW maximum per FCC rules for FRS.

The actual frequencies for channela 1-7 of FRS, and GMRS are the same, but GMRS may use a maximum of 5 W, while FRS are limited to 500 mW. So ... if you get the whole neighborhood to use FRS Channel 1, it is my bet they are using GMRS Channel 1 radfios and would have to have an FCC GMRS license to use them.

E-bay seems to be the on;y source I have found for FRS-only (14 channel radios).

Any thoughts?

By the way, my immediate family of four have four ICOM F21-GM handhelds, and a set of blisterpack GMRS radios.

Best Wishes,

Chris Catotti

10286. USING F-R-S CHANNEL 1

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-24 22:41:35 UTC
From: Lake Hodges Radio
Topic: 10286 Message: 10286

Why bother with FRS only radios? Buy the dual FRS/GMRS radios instead.

Get a GMRS license if you want to use channels 15 to 22.

Use only channels 8 - 14 @ 500mw if you don't want to pay for a license -- that's totally legal.

Check the radio to see if you can reduce channels 1-7 down to 500mw.

If you use the full 2 watts or 5 watts on channel 1, you technically need a GMRS license. But -- the FCC approved those radios for sale to the mass public, and I sincerely doubt that they plan to enforce the 500mw limit on channels 1 - 7.

They have bigger fish to fry.

Good luck!

10287. USING F-R-S CHANNEL 1

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-24 22:57:59 UTC
From: Lake Hodges Radio
Topic: 10286 Message: 10287

Another thought...

If you are REALLY DETERMINED to stay under the 500mw ERP limit with your FRS/GMRS combo radios on channels 1 - 7 you could probably do the following -->> Get a field strength meter that measures ERP. Measure the radio's output on channel 1. Use wire cutters or a hack saw to cut off small portions of the rubber antenna until the ERP drops below 500mw. Experiment until you find the right length, then cut your other radios to match.

Read Part 95 to make sure, but I think the regulated limit is ERP. This is not the power produced by the transmitter, it is the effective power radiated from the antenna. By reducing the size of the antenna and lowering the effective gain, you would be able to reduce the ERP to the level you want.

Having said that --- if you actually do this you will probably be the first of 30 million FRS/GMRS bubble pack owners to do this. Most people just operate at the 2w to 4w level on channels 1 to 7 and the FCC doesn't seem to care.

Any radio engineer knows that the practical difference in range between 500mw and 5w on UHF FM is barely measurable on the cheap bubble pack radios with their low gain rubber antennas. Either of those power levels will be limited by terrain, buildings and line-of-sight clearances.

Good luck!

10289. SWR Question

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-25 00:00:40 UTC
From: Mike
Topic: 10289 Message: 10289

I live in central Fla. Due to hurricane Wilma I had to bring my antenna's in. After the storm left today I decide to put them back outside. Upon checking the SWR on the GRMS, the meter did not move. Thinking the meter maybe bad, I hooked it up to my Ham rig, worked fine. I then tried the gmrs again and had no movement. I hooked a mag mount up to the gmrs and measured just over 1.5 but below 2. I rehook the outside antenna, and again no movement,Before the storm I had a reading of about 1.2. Could my antenna be bad? or just perfect?

10290. Re: SWR Question

Hi Mike,
What kind of performance are you getting? That should answer your question.

Joe

Well I know I am hitting the repeaters without a problem. I will try
simplex tomorrow

Hello, My name is Mike and I live in Sacramento, CA.
My GMRS call is WQDA998. Can anyone tell me if there are any repeaters or groups in the Sacramento area I could join or contact?. Right now I have a couple of bubble pack radios, but will be getting some Icom rigs in the near future.
Thanks for having a group like this so us newbies can get a handle on this stuff.

Good idea but there is also a rule that one must not
modify the antenna! This also includes trimming.

10295. Re: USING F-R-S CHANNEL 1

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-25 14:30:04 UTC
From: Bill
Topic: 10286 Message: 10295

Cut off portions of the antenna!!! Wait a minute! No offense here
but that is not a good idea.

As a ham radio operator and experimeter of antennas my opinion on
cutting the antenna off makes the antenna "nonresonate", meaning the
antenna is off frequency for its intended band. It will reduce the
EPR but it will also cause the finals to overheat (over time) and
burn out. Then you throw the radio away because replacing finals (if
there are any in cheap radios)becomes more costly than buying a new
talkie.

Better off getting the license and enjoy the additional power.

Hi,

Recently, purchased the Motorola SX700R FRS/GMRS hand held two-way.
It has a 12 mile rating with a max rf output of 2 watts. Then, I spotted this nice Midland GXT500 model with a 14 mile rating with a max rf output of 5 watts. Both take a 6 volt dc battery supply. Anybody out there own either or both? If so, would appreciate some comments. I suppose you can always have a spare on hand, if the other becomes destroyed or ruined. I like using the GMRS frequencies , when hiking at a campsite..They're great going biking with a bunch of others or just going in a group to an amusment park or country fair, so the members, who split up don't get lost. They're also great on a big lake or on a boat in the ocean, when there are other members on the shoreline, since cell towers don't respond greatly
off the Atlantic coastline.
Your comments are much appreciated! By the way, I just became a new member to this yahoogroup..Great way to meet others involved in this two way radio hobby..

Lee (WQDM801)

Topic: 10299 Message: 10299

Howdy,

Lee here from southeastern Connecticut, near Foxwoods Casino and Mohegan Sun Resort. My GMRS call sign is WQDM801..Anyone in this group from Connecticut, Rhode Island, or Massachusetts? Looking for a GMRS repeater, that I could get permission to use in the near future.. Anybody know that answer?

10300. Anyone own and like their Midland and/or Motorola ?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-25 19:42:41 UTC
From: Lee Paul
Topic: 10300 Message: 10300

Hi !

Recently purchased a Motorola Talkabout Model SX700R portable and about a month later purchased a Midland Model GXT500 portable. I like the Midland better, since it puts out 5 W RF power; operates off a 6 V DC power supply; and gets better reception too. Does anybody own either and what are your opinions of the Motorola and Midland handheld 2-way units? In the future, I hope to pick up either a Kenwood Mobile and Base set up to operate off a repeater system or go with ICOM's products to get better distance. Your feedback is certainly much appreciated..

What is the wattage of the radio?
I've had that happen when the tuning was good
along with a low power radio in need of new batteries.

New to your grp. Considering purchase of GMRS radio, particulary the Motorola SX-700. If in the future, we put up a repeater, is this radio compatible?

If I may ask. What SWR meter are you using? I would like to get one for UHF (GMRS) and finding one locally is proving to be a challenge. Anyone else have any recommendations?

Lee,

12 or 14 miles or even 50 miles for FRS units (doesn't matter if it's a combo pack), the radios will not transmit up to that distance. Unless you're in the Sahara Desert...

It's all advertising gimicks and lies. I have tried radios like those, and all have failed. If you're serious about GMRS, try commercially made radios, not bubble-packs. They may be a bit more expensive, but you will get more for your money and that distance you're trying to achieve. Plus, all components and audio have great quality and will last much longer than bubble-packs. You drop them, or use them in the rain (flooding, storms, etc), they'll come back to life, whereas if you use bubble-packs in those same types of conditions, chances are very slim that they'll work the same before or even like new...

This is just some helpful future tips and advice for you. Since you (like many, many others that have joined this group) are new to this, I thought I'd give you a heads up before putting your life savings into these types of radios.

As for keeping which radio? I'd say sell them both and get yourself a commercial-grade radio with the same features, but with a higher standard in quality and you'll have the option to use them with repeater systems for extended communication range. Which in most and many cases, is much greater than 12 or 14 miles.

Good luck with the search, and if you come across something that is too good to be true, it probably isn't worth your time. ...in my opinion. =c)

I got mine off of eBay. I'm just using a standard UHF (440-470) SWR meter with power meter. Works great. I think it'll run about $30 or so. Which isn't too bad either.

eBay is your best bet in stuff like that, if you don't have a ham radio shop nearby.

>?5 W RF power;

Those Midland actually do NOT have a 5 watt output. At the FCC site, it
shows they put out about 1.5 Watts!

Click on this link to see the FCC grant.

https://gullfoss2.fcc.gov/prod/oet/cf/tcb/reports/Tcb731GrantForm.cfm?mode=COPY&RequestTim
eout=500&application_id=721105&fcc_id=MMAGXT500

If it doesn't work Go here to manually look it up:
https://gullfoss2.fcc.gov/prod/oet/cf/eas/reports/GenericSearch.cfm

Use MMA as manufacturer code and GXT500 as the product code.

You will see all the FCC data on this radio.

Sorry you got took by manufacturer lies.

The ICOM F21 has the jacks that you need.
I've never tried one with that repeater but I've used
that repeater with radios that will interchange speaker
mics with the ICOM.

10318. Re: [GMRS] repeater compatible GMRS radios

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-28 02:32:34 UTC
From: kvsp1160@aol.com
Topic: 10302 Message: 10318

If this is a bubble-pack, chances are that it will not be repeater capable.

As I tell everyone on this group, save yourself time, trouble, and cost by buying a commercial-grade radio for GMRS. Will outlast bubble-packs and doesn't use AA batteries. =c)

HT's run around $50-$100 or more, depending upon what features it has and what it comes with.

Mobiles run a little more, but still worth every penny, as bubble-packs don't offer mobile capabilities.

Think hard and do a little research before you purchase your first radio. If you want FRS or cheap products, bubble-packs are the way to go. If you expect quality and longer-lasting equipment, go with commercial-grade radios. The choice is yours, but the results are up to the radio.

10320. GMRS License

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-29 03:07:25 UTC
From: stee_dee
Topic: 195 Message: 10320

Per http://wireless.fcc.gov/services/personal/generalmobile/ ... it states: "The General Mobile Radio Service (GMRS) is a land-mobile radio service available for short-distance two-way communications to facilitate the activities of an adult individual and his or her immediate family members, including a spouse, children, parents, grandparents, aunts, uncles, nephews, nieces, and in-laws (47 CFR 95.179). Normally, as a GMRS system licensee, you and your family members would communicate among yourselves over the general area of your residence or during recreational group outings, such as camping or hiking."
The key words I picked up on are Nephews... does that mean I can have my entire family under my GMRS license? And if that's true will they be able to use MEGMRS repeaters?
The reason I asked, is I have 4 nephews, 1 in Iraq (Army) and 3 on STLPD. 2 of 4 have shown interest in installing a mobile in their vehicles. If the above is true, can they use my gmrs license?

Yes it is true, they can use your license. We covered this topic considerably when dealing with COUSINS, which collective thought was that it wasn't allowed, which was odd in on itself. I digress, to answer your questions, nephews and nieces are allowed. Enjoy!

10324. Making heads and tails of radios

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-30 15:15:20 UTC
From: travelclarkie
Topic: 10324 Message: 10324

Hello,

I just got my GMRS license and now it's time to find a radio.

I'm sorry if this is all been beaten to death but Going though ALL the archives get old. I did take a look for the last month or 2.

I want to avoid a "bubble wrap" radio because I don't want a toy. So I am looking at more commercially oriented radio's - unless you have other suggestions.

Here are my questions (and there subquestions):

1)Suggestions of radio's. Since there are so many to choose from. There are a few Motorola's that have been suggested to me but they are cost 600-750 a peice.

2) How to program the radio?
-Should I do all 23 (per FCC website) 22 by other sites as simple?
-Should I program the repeater pairs (ie: http://www.rampart-sar.com/gmrs.htm)
-Other option combination. Simplex except for the 1 REACT repeater (I will be joining) and maybe the "national" emergency repeater pair (which by the way makes no since if there is no repeater then people will be missing each others transmission since no one monitors the input).
-What is the etiquette when it comes to doing simplex on repeater splits if no repeater exists? I know in the ham band you stay off the repeater frequencies.

3) What is the correct number of channels 22 or 23? and why the discrepancy?

Thank you,

Geoff

As a side comment to beat a possible suggestion. I'm not going to mod my ham equipment - Been there done that been bitten in the butt for it.

Topic: 195 Message: 10325

Chris is correct in that the reg says nothing about where the relation lives. By excluding any language about residency, it clearly indicates that resident location is not a factor. In fact, the licensee may be in Florida and the applicable relative could reside in any state or even Puerto Rico, American Virgin Islands, Guam, or American Samoa - basically anywhere the FCC has jurisdiction over GMRS including aboard US flagged vessels while operating in international waters.

Read the regulation about relatives very carefully. There is separate language on the subject of who may be station operators for the grandfathered 'non-individual' [i.e.; business] licenses that were previously granted.

Sec. 95.179 Individuals who may be station operators.

(a) An individual GMRS system licensee may permit immediate family members to be station operators in his or her GMRS system. Immediate family members are the:
(1) Licensee;
(2) Licensee's spouse;
(3) Licensee's children, grandchildren, stepchildren;
(4) Licensee's parents, grandparents, stepparents;
(5) Licensee's brothers, sisters;
(6) Licensee's aunts, uncles, nieces, nephews; and
(7) Licensee's in-laws.

Note the wording that says ".... GMRS system licensee may permit .... ". This means that the licensee's relations are not automatically granted GMRS privileges just because they are related (as the reg notes) to the licensee. This is done to protect the licensee, as the licensee is responsible for the operation of all who operate on that license. The licensee MAY PERMIT... In the language of federal regulations of all types, there is marked difference between the words 'may', 'shall', 'should', and 'must', etc.

Unfortunately, in the GMRS regs, the FCC did not have the foresight to require written permission, as is done in the public safety arena where for example a county sheriff's department allows other agencies like a local constable to share their radio system.

10326. Re: [GMRS] Making heads and tails of radios

Yahoo group: GMRS (2005 — 2007)
Date: 2005-10-31 00:43:55 UTC
From: kvsp1160@aol.com
Topic: 10324 Message: 10326

I'll reply to the third question...

There are only 16 GMRS frequencies, or 8 pairs (simplex/duplex):

462/467.550
462/467.575
462/467.600
462/467.625
462/467.650
462/467.675
462/467.700
462/467.725

The 462.xxx frequencies are used for simplex communications. The 467.xxx frequencies are used for duplex or repeater communications only. You may not use the 467 freqs for simplex use. Not allowed. On a side note: Ham bands allow you to operate on all frequencies allocated to their license coverage. When a ham frequency becomes a part of a repeater, is when you have a frequency with a + or - to receive the signal (442.500TX, 447.500RX / + disposition) (449.325TX, 444.325RX / - disposition).

Very different from GMRS bands.

The reason that the FCC says 22 or 23, is because they're considering the FRS channels 1-7 to be a part of GMRS, but they are not true GMRS frequencies. Only shared. With a maximum power rating of only 1 watt, versus 50 watts on the GMRS-specific frequencies.

Hope this covered it. 73!

>considerably when dealing with COUSINS, which collective thought was
>that it wasn't allowed, which was odd in on itself. I digress, to
>answer your questions, nephews and nieces are allowed. Enjoy!

Keep in mind that as the holder of the license, you are solely responsible for their actions. Any laws broken where it can be shown they were using radios under you license could find charges being charged against you as well, even though your thousands of miles away. Not only could you lose your GMRS license, but any other licenses you might own as well as not being able to obtain another one in the future. That's why my brother, wifes parents, sisters, etc.. are allowed to use radios under my license only when I am in the vicinity of them. Otherwise, if they find the need, they will need to get their own license.

My suggestion would be for you to pay the $80. for one of them to get a license. If both nephews are brothers, and not cousins, then both could work off the one license. Just keep in mind that the license holder is liable for both persons actions. This way you license is safe and they can enjoy the interest.

Ryan,
What does that say about the bubble wrap radio's that have 22 channels
and are not configured for repeaters?
Also, when you say "Not allowed" is it illegal or just poor taste? If
it's illegal then how did the radio get accepted by the FCC.
As a side note. I'm definitely appreciating the ARRL more and their
publications :)

$650 - $700 per radio, really. I've never paid over $200 for any of my radios, handheld or mobile. Actually my mobiles never cost over $125 and the only reason my handhelds cost $200 was that I wanted what I thought was the best for my needs. I use nothing but Kenwoods. Mobiles are TK-805D. The nice thing about this radio is that with the press of a couple buttons while powering up the radio, you can put it into programming mode with out a computer or software.

My handhelds, Tk-390's, are capable of 160 channels but for 99.9999999999% of my communications, I use one frequency pair, 467.675/462.675 (repeater) and 462.675/462.675 (talk around). Good first time Kenwood's are TK-350's, TK-360's (4 channel) and TK-360G's (8 channel).

Keep in mind that while you have the use of 8 repeater pairs and 8 simplex pairs, that your seldom going to use more than two or three of them. Remember, as with ham frequencies, you have your sub tones (CTCS and/or DCS).. So even though you may be able to hear someone on a channel when you monitor before transmitting, you do, don't you? Unless you know the tone they are using, they won't hear you when you try to contact them unless they don't have tones enabled, which is seldom the case.

Your welcome to send me a private message if you have other questions.

While my last post hold true and I'd still like an answer I want to see
if I understand this.

here is my reference:
http://wireless.fcc.gov/services/personal/generalmobile/data/bandplan.html

here are the total of the 23 channels.

The first 2 groups are simplex. Being made up of the FRS and GMRS
Simplex channels

The 3rd Group is the output for repeaters and is more or less reserved
for that.

but it still leaves the bubble wrap radios

Geoff.

I'm not Ryan, but....

There are several "flavors" of frs/gmrs radios.

14 channels. FRS ONLY. No repeaters allowed.

15 channels. GMRS radio. First 7 channels are shared with FRS, next 8 are GMRS repeater output/simplex only. Not repeater capable.

16 channels. GMRS ONLY. 8 repeater output/simplex frequencies AND the 8 repeater INPUTS. Repeater capable.

22 channels. Combination FRS/GMRS radio. Has all 14 FRS channels (including 7 shared w/GMRS) , and the 8 GMRS repeater output/simplex frequencies. Not repeater capable.

23 channels. GMRS ONLY. Has the 7 shared frequencies, the repeater outputs AND the repeater inputs, therefore, repeater capable. Don't *personally* know of any programmed up like this.

All except the 14 channel require a license.

Walter, WPXP269

PS: "Not allowed" means not permitted by the FCC rules, therefore illegal.

PPS: There ARE 23 GMRS frequencies, including the 7 "splinter" channels shared with FRS.

From: kvsp1160@aol.com
Topic: 10324 Message: 10333

Geoff,

I'm not sure I understand your first question, so I'll let it be. The second one with the "not allowed" pertains to operating a simplex unit to TX and RX on 467.xxx. It's not proper etiquette, and will conflict with any repeater in that area which may be on the same tone. Repeaters operate on the 467 band (RX on 467.xxx / TX on 462.xxx) From my understanding over the past 4-5 years of being on GMRS and over 10 years on radio comm in general, this is the way to do it.

For those who need physical proof from the FCC, I've addeed a link which pertains to Part 95.29:
http://a257.g.akamaitech.net/7/257/2422/12feb20041500/edocket.access.gpo.gov/cfr_2004/octqtr/47cfr95.29.htm

Hope it helps. 73,
Ryan

From: Johnny
Topic: 10334 Message: 10334

It seems that gmrl.org (General Mobile Radio League) is available for domain registry, if anyone wants to start up the GMRL to lobby for the better of GMRS users in D.C.

The biggest goal I would want the League to achieve is a FAIR license fee for GMRS, since ham radio non-vanity callsigns are totally free (VEC test fee not included).

I use a Yaesu VX-6R modded to broadcast in the GMRS range. My girlfriend uses a one of my bubble wrap Uniden GMRS680s, a fantastic little 2w radio that they don't make anymore (the things are tiny, which she wants -- why are all the new bubble wrap radios so huge?) She can fit the little Uniden in her purse and I can fit the VX-6R in my back pocket and we can talk at pretty much any distance we need to. Oh, and neither of us have licenses but I think the GMRS license is just a bullshit money grab for the FCC anyway. You don't even have to announce your callsign on the air. It's BS. I do have an amateur radio license.

Anyway check out the VX-6R. It's around $250 and you can use it if you have a Tech license as well.

if you are going to use GMRS freg. or any freg it should be done by the rules. One reason you could not get to use my repeater without a call sign. And if I am having problems with you and you don't have a call sign I would be the first to drop a dime on you.

And what do you mean " You don't even have to announce your callsign on the air"?????
Just like your ham license requires you to ID, GMRS is required to.
Just because you choose not to, doesn't mean it's not required.

Walter

Not to mention that modifying a radio to TX where it is not FCC type
certified is illegal.

John,

I am a ham and I have a great deal of respect for all of the radio services and their various rules and regulations. I do not feel that any radio service is a "playtoy", and I would venture to guess that most hams feel the way I do. To be sure, we have our share of morons, but I think you will find that they are less of a statistic for us than for the general population. Please do not classify an entire group of people because of the actions of a few bad apples.

I am aware most amateur operators operate properly. My intention was
to demean the clod and everything he stood for. I go for maximum
shock against the enemy. It was not my intention to demean an entire
service and its operators. I am aware, locally, an amateur operator
has a GMRS repeater he uses as a playtoy, not using a GMRS call sign
and such. Regardless, I think highly of the amateur community.

Ah, you guys crack me up. I don't use "repeaters" on GMRS anyway, and personally I think they should be banned. To me GMRS should be essentially combined with FRS and licensed at $5 a year per family. GMRS isn't hobby radio like most of the rubes here think it is. It's designed for family members to talk to one another over their property or on short excursions like to Disneyland. That's it. I have an amateur radio license but I'll be the first to tell you that it's when ham radio dorks start sticking their self-righteous noses into things that everything goes downhill.

$160 to license me and my girlfriend so we can talk for 5 minutes once every couple of months? Fuck that. That's ridiculous. I follow the rules when they're not retarded.

And to those who want to "find out my call sign" and report me to the FCC I say go ahead. I'd be happy to tell them what I think of their organization. Of course that supposes that the FCC would give a rat's ass, which they don't have the money to do at this point, but whatever.

NOT ALL HAMS are breaking the rules.
using Motorola MT 1000 99 Ch and also MT 1000
16 Ch. for GMRS USE Type accepted on GMRS.
and also use on 70cm on ham band that requires NO type acceptance.

10351. Recommendations for a nine year old son

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-03 04:46:19 UTC
From: schnoor1648
Topic: 10351 Message: 10351

I have been away from the radio scene for a little while, so I am looking for some recommendations. We went camping this past weekend and the neighbors that camped with us had the small UHF radios. I would like to get one for my nine year old son so that he can communicate with the neighbor boy. Anyway, my requirements are:

-rechargeable battery (either a pack or separate cells)

-capable of PL tone (certainly analog PL, but both PL and DPL is okay, too, but not absolutely necessary)

Are there any radios that are decent or are they all junk? I don't expect a radio like this to be as durable as a Motorola MTS5000 or a Thales Racal 25, but it would be nice if it is at least somewhat durable.

10352. Re: [GMRS] Re: Making heads and tails of radios

Topic: 10324 Message: 10352

Somebody get this guy off of here. I've been too insulted by this guy to read the rest of his email. And to think he can make judgement against our community and the rules that the FCC has posted for us, has gone too far.

will_210:

The GMRS community Is Not a hobby. GMRS is licensed for a reason. We are here to serve communication needs for our family, long-distance community events, emergency needs, and group gatherings to help serve other GMRS communities with their needs. GMRS is not here to find projects to bsee who can build the biggest radio, communicate with others in other countries, or to see who can be contacted with CQ or QSO. The GMRS community is simple here as a community.

With that said, we are very proud and supportive with our equipment and quality that we have with our communicatons. We don't want to be joined with FRS, nor do we want our licensing fees downgraded to $5 per year. It's like saying heck with GMRS and let's go CB again! Not at all. There are more people and communities across the US that own and operate repeater systems, emergency groups, assist police, fire, and EMT's, and have no regrets of paying that $80 for their license.

Whatever your problem is, or if you have a certain hate or guilt against GMRS, please take it elsewhere. If you have a question about your radio, or need help with some equipment, we are here to help. But not to handle low self-esteem or hatred against GMRS and why it's here.

We'd be more than happy to give you contact information to the FCC if you have problems with that. But PLEASE DO NOT Take it out on us. We don't have the answers you're looking for.

73,
Ryan

Hi,

Thanks for your questions. I'm gonna try and take a stab at this one. =c)

First off, do you have a GMRS license? If you do, then I'd suggest to get a Motorola Talkabout radio, which includes the GMRS and FRS frequencies. GMRS is the General Mobile Radio Service. This system has eight frequencies with a higher power rating than FRS (Family Radio Service). If your son will be talking with his friend next door or across the block, the GMRS/FRS radio will handle just fine. Even if they're at a park or are talking across a 2-3 block distance. But the license will cost $80 for 5 years (for your entire immediate family).

If you want something simple, stay with the FRS radios. They are less costly, and have a shorter talk range, but you won't have to worry about licensing or if your son is talking on frequencies that are illegal to use. You can still talk to his friend next door, at the park, and across a one block radius. And the radios can be used with any other FRS type system.

Both systems have rechargable batteries, tones, 14 channels (FRS), or 22 channels (GMRS), and prices range anywhere from $20 up to $150+. Also these radios usually come in pairs, so the parents can use them too, which can come in handy.

As for brands, I have always trusted Motorola or Cobra radios. I have Motorola here at home and it's been through rain, snow, storms, been dropped, stepped on, and still operates like new. If you do decide to go with GMRS, please get the license. We'd really appreciate that. If you go with FRS, then we have no worries.

Enjoy your radios, and if you have any further questions, feel free to ask.
73! (best wishes)

Can't ya feel the LOOOOOOOOOVE spreading here!! Are some of the members here from Kalifornia!? Let's see,if I remember, these heated discussions were the result of "nonacceptance" type radios? By todays standards that word is meaningless, except if your are an FCC agent. As a licensed ham radio operator, if I build a radio from scratch is it accepted as meeting a particular "part" of a regulation. My guess is that it would not be nearly as clean as a commerically made radio yet I can use it! If one wanted to use a modified radio to work in another band and it was clean and didn't create mushy harmonics, ets, who's going to know. If it does, I believe the community would kick his hairy butt into another hobby. If not, then that's our fault. Come on children! Just because the speed limit on an Interstate Highway says 65 MPH do we all drive at that speed. Nooooooooooo. So all you regulatory hacks out there, it's okay to repeat the rules and regs but let's not get pissy about it.

Here are my call signs.

Hey dude, it was you guys who started the assault. I'm just defending myself from your unprovoked attacks. If you look at my original post I was responding to a guy who asked what type of radio to use. I told him what I and my girlfriend use, and one of them happens to be a ham radio modded to broadcast on the GMRS freqs. I also suggested to the guy that he not bother with the BS $80 FCC money-grab license.

That's when you all started acting like sociopaths with ad hominem attacks up the wazoo. Instead of offering intelligent counter-arguments as to why the FCC license isn't bullshit, you just say essentially "you suck" which is hardly an argument.

Anyhow, you guys, if you don't already, should get your ham tickets. You respond to criticism EXACTLY the way the ham community does. You'd fit right in.

Furthermore, individual FAMILIES are the GMRS "community." Not a bunch of dudes. Join amateur radio. Let me and my girlfriend and our families use the FRS/GMRS freqs in the way we want to.

The attacks were provoked. You are an unlicensed GMRS
user and are blatantly disregarding the regulations.

If

Yes.. in violation of FCC regulations.

>I also suggested to the guy that he not bother with

Not our place to agree or disagree. It is our place
to comply with regulations. I think $80 is steep.
Not a small chnk of change by any means, yet is
required, so I paid.

> you just say
> essentially "you suck" which is hardly an argument.

It is a good argument. If you use GMRS without a
license, you *do* suck.

>
> Anyhow, you guys, if you don't already, should get
> your ham tickets.

Yes... and if we do, we'd follow the regulations for amateur radio.

> You respond to criticism EXACTLY the way the ham
> community does.
> You'd fit right in.

I'd do nothing to be criticised for. *I* follow the rules.

>
> Furthermore, individual FAMILIES are the GMRS

No... licensed users are the GMRS comunity. These consist of families.... but they are LICENSED!

> Not a
> bunch of dudes. Join amateur radio. Let me and my

we have about 12 or more licenses we pay for and feel it is the way it is set up and we go by the rules. At one time there was another in the area that was the same about not having any licenses. He had a ham one at one time but not use if any other as he did not like the FCC. Well after a number of fines and warnings and he kept it up one day the FCC and the US Marshals show up at his house at 6 AM. Well they took it all even his tower. Have not heard or seen him in a number of years. (maybe it is will_210 with a new indemnity)

Well that is how it was here and we do play by the FCC rules.

Topic: 10324 Message: 10361

See, now I think I found the problem...

Lemme quote some text from "will_210" for you:

"I told him what I and my girlfriend use, and one of them
happens to be a ham radio modded to broadcast on the GMRS freqs."

"I also suggested to the guy that he not bother with the BS $80 FCC
money-grab license."

"as to why the FCC license isn't bull****, you just say
essentially "you suck" which is hardly an argument."

"individual FAMILIES are the GMRS "community." Not a
bunch of dudes."

"Let me and my girlfriend and our families use the FRS/GMRS
freqs in the way we want to."

And here's the solution:

- Most and many of us do not use modified ham radios for our GMRS equipment.
Those that do, don't go bragging about it. We tend to report them anyways...

- Licenses are there for a reason. Doesn't matter how much a person pays,
it's the reason that they're paying that matters. Talk with the FCC about that.

- Don't like cussing here, especially to the FCC. Not a good idea. Kinda
makes the group look bad.

- There are guys and girls here on this group. And we are a part of our own
family and one big family which makes it a community and a group to start with.
Which is one of the reasons why GMRS still exists.

- Using GMRS the way you want, and not the way the FCC intended to is wrong.

Will, just because we complain about you and what you say, doesn't mean we're
perfect. We've been here long enough to have seen more "whatever" than you
have and we're pretty tired of it. Yes, we can leave the group and GMRS, but
we'd rather not because there's a reason why. I'm sorry that it seemed like we
got on your case, but you did tend to point some fingers at us too. And that
doesn't make it right.

A community doesn't have to be a group of families. It can be anyone who
loves working together with others on the same type of project, which forms a
small group that coordinates ideas and systems, then forms into a community where
we discuss problems, solutions, and other issues about our given subject:
GMRS. The GMRS group doesn't always bicker about rules or people joining the group

with wrong ideas. We also talk about marketing issues, storm emergencies, equipment solutions, and help those who are becoming interested in the GMRS community.

That's how this group became a group of 100 to over 2,000. And most of us just read the topics and get involved in their own way. Others join in the discussions and help out as well. However it works out, and whatever the reason is, we are here to help. And we certanly don't mean to get on each others cases. But it does happen once in a while. Just like in a real family.

So please take my apologee, don't add to the arguement, and start a new topic. We're both wrong. So we'll start over and take the good knowledge that we have and find a solution from that.

I think what this group is trying to say is that this list wants to give legal technical advice and support to those using the GMRS band. The simple thing to do would be just to disallow your posts to come thru. I guess we are not moderated.(if we were this probably wouldn't get thru) Perhaps you can find a list that will welcome a free spirit, shoot from the hip, wild and crazy kind of guy(long for a$%#ole) such as yourself to give advice.
Anyway I have a few questions you might answer:
What's a hominem?
What's a sociopath's wazoo got to do with it.
Why DO you suck?
What have you got against freaks?

These are not radio questions so bad advice won't hurt anyone.

10365. Priority Scanning

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-06 05:31:36 UTC
From: schnoor1648
Topic: 10351 Message: 10365

I thought I saw priority scanning highlighted as a feature of a Motorola handheld transceiver recently. Is this somewhat unique for FRS, GMRS, or MURS radios? I know that I have seen other radios that will scan, but now that I think about it it may have been plain scanning in that you may miss traffic on a selected channel when scanning if it does not automaticaly switch to the slected channel when a signal is present. Maybe I am being too picky, but non-priority scanning seems sort of risky if you want to be able to be reached on a particular channel.

Unit is in excellent condition. It is the UHF 40 watt alpha-numeric
diplay model. Includes power cable and palm mic.

I also have an Astron RS20 power supply in mint condition.

I am looking for $200.00 for the mobile and $75.00 for the power supply.

Thanks!

Hey !!

I am in a search mode and trying to find, open and user friendly gmrs repeater sites in Connecticut, preferably in the southeastern region of New London county where the indian casinos are located. My internet search has not been too successful. Even if you do not live in Connecticut or New England (Northeast) does anyone out there have any information regarding this matter?? Please either submit it to this yahoogroup via email or to my own personal yahoo email box. Your help in this matter is greatly appreciated!

Thnx,
Lee (WQDM801)

My RPU-499A has this feature, and it works well. It also has automatic talkback, which is also a great feature. Lets me scan the ham band at work while keeping an ear on the bubble pack frequency we all use. Not bad for under $200.00.

I usually stay out of flamewars but I'd like to make a couple of points:

1) Not everyone is a US resident subject to the FCC regulations.
2) Not every country requires a license to use GMRS.

Does the fact that I live in Canada, in which GMRS frequencies is *unregulated* (up to 2W transmitting power) -- so I never had to pay a cent to the FCC or any other agency for the privilege of legally using a GMRS radio, also makes me "NOT PART of the GMRS community"? If that is the case, you better restrict membership to US residents.

Best wishes,
Alex.

If you can get the FCC ID off the radios, you can look
'em up in the FCC database and see if they are Part
95A (GMRS) accepted.

if my Brain is working correct their is a little Trick look on the Radio
their is a little Decal/Sticker
that say fcc ID and a Bunch of other number if you find that it most Likely
it Type accepted
it you can't find it they it maynot be.

I would like to set up a GMRS base station without getting a mobile unit and a regulated power supply (aesthetics are an issue). Is there anything out there powered by AC? I'm not interested in the Audiovox option. Thanks.

WELL... =c)

GE made these base radio's called the Mastr Executive II. I have a few here.
I might have one for sale soon, if what I have works.

They are FCC accepted for parts 89, 90 and 95. So it's perfect for GMRS.
Depends upon what model you get, the power ranges from 30 watts up to 110 watts,
but will need to be tuned down to 50 watts max for GMRS use. They come with 1-8
channels, and can be modified into a repeater with a few jumpers here and
there. The Exec II runs on 110 VAC, 5A. And has a great duty cycle, so it can be
left on for long periods.

I'm sure that there are other makes and models out there like the Uniden,
Kenwood, Motorola, and other old ones, which would serve your needs, but you
might need to spend a little more to change the frequencies that you would need.

These radios cost between $40 and $200 on eBay or other used radio place.
They may be old, but their components were built to last a hundred years!

Well the looooooove still flows here. In my comments about the GMRS community kicking out the "nonconformers" or actually those who "may" cause communication problems with "questionable" radios was directed to the GMRS community, not this Yahoo group. The membership here could be people just trying to get information before taking the plunge into this hobby.

As for any of those here who are residents of another country, ie. Canada, you shouldn't be directing the show here because your country operates differenly with regards to the unregulated use of certain two-way communications. Although this group may be open to ALL who qualifies and gets accepted it may not be the place to get testy about regulations that don't affect you.

There is an invisible line that divides our two countries, it's called the US/Canadian border. Much alike in some aspects and quite different in others. Any of my posts (up to now a few) will be directed towards US users. Lets not get the regs of one country confused with another. You deal with yours and we'll deal with ours.

I believe the license application for GMRS asked if I, as the applicant, was a US citizen. If I would have answered no, would the FCC still grant me a license? I don't think so. Also, if you are going to use two-way communications here in the US you'd best have a license. If you can't qualify for a license better keep your lips off the mic. Getting a license is a privilege, not a right. There is a difference.

Over and out, Good Buddy! Sorry, had to say it.

10387. Emergency Channel?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-08 21:57:00 UTC
From: skyward4me
Topic: 10387 Message: 10387

Hi,

I'm new to this group and joined because I am considering GMRS mainly to use for emergencies when I'm on the road. I know back in the CB days the police would monitor Ch 9 for emergency calls. Is there a similar channel on GMRS that they monitor for the same pupose?

Also, I live in Winnipeg, so I don't know if the Canadian version will work in the US or Visa-Versa. Since I travel in both countries, hopefully it can be used in both countries.

Thanks in advance,
Vince

Topic: 10370 Message: 10388

95 or 95A. Either one works. I'm not really sure why people add the "A" to the part. Maybe it's their way of saying that it's the first section of Part 95 that pertains to GMRS.

On an official point of view, Part 95 relates to the GMRS rules and regulations of the FCC. Within the part 95, there are sub-parts that explain different points and rules for that type of service (GMRS, FRS, R/C, CB), which are all a part of the Wireless Telecommunication Bureau, per FCC.

With that said, your radio meets and exceeds the Part 95 requirements. It meets Parts 22, 74, 90 and 95.

10389. GMRS is not a hobby - Why?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-09 06:55:44 UTC
From: kvsp1160@aol.com
Topic: 10389 Message: 10389

Hi everyone,

To correct the new guys and the old ones, and also as a refresher for the mind, the General Mobile Radio Service is NOT a hobby. It is a service to families and other individuals to provide communications for personal, emergency, and other uses.

The Amateur Radio Service is a hobby, because the individual person may not share it's license with it's family, has to study and take a test for their license, and is able to build, modify, and change the equipment that they facilitate for their communication needs. This is done via CW, Packet, Voice, and Microwave. It is there to help them better understand what cradio communications is all about, and allows them to talk to other people across the US, Canada, Russia, Europe, etc by radio, satellite, etc.

GMRS is not intended for those purposes. It was only intended for short-distance (under 100 miles) communications via simplex or duplex Voice communications. GMRS is able to use repeaters with voice or CW ID'ers every 15 minutes, but may not use CW or other coded messages on the repeater or on any simplex frequency. A repeater may transmit a signal with a power of up to a maximum of 50 watts TPO (transmitter power output). You may not use auto-patch, modem or packet, CW (morse code), or other types of communications that Does Not involve Voice. Voting or remote sites are not allowed, as they both require communications between systems via phone line.

The antenna must not exceed 200 feet above the ground or 200 feet above the roofline of the structure you are using. If near an airport, you must (are required to) file a special license with the FAA to allow the use of an antenna or antenna structure around these surroundings.

A new GMRS license costs $85 for the first five (5) years. A GMRS license is either a 4x3 or a 3x4 callsign: WPXX201 (4x3), KAX0319 (3x4).

Part 95 (95.1 thru 95.183) of the FCC rules for the GMRS may be found here:
http://www.access.gpo.gov/nara/cfr/waisidx_04/47cfr95_04.html

I hope that this covers some of your questions that pertains to rules and regs of the FCC for the GMRS. If you want information on how to properly use a repeater, please email me. Enjoy your week, and I look forward to many more interesting conversations with this group. Thanks for everything!

73,
Ryan

It is the language as described in grants given FCC type acceptance by the FCC Office of Engineering and technology.They subclassify type acceptance that way.You can have radios ONLY type-accepted for one of the parts only.An FRS radio would only be part 95B type accepted, whereas a FRS/GMRS "hybrid" would be both 95A and 95B type accepted.See example below of an extract from an FCC equipment grant:

EQUIPMENT AUTHORIZATION is hereby issued to the named GRANTEE, and is VALID ONLY for the equipment identified hereon for use under the Commission's Rules and Regulations listed below.
FCC IDENTIFIER: KLL2101904Name of Grantee: Tekcom Industries LimitedEquipment Class:Part 95 Family Radio Face Held TransmitterNotes:22CH FRS/ GMRS Transceiver
Grant Notes FCC Rule Parts Frequency
Range (MHZ) Output

Nope. There was, at one time, a frequency that was kind of pushed as
a sort of calling/assistance frequency that has gone by the wayside.
Nothing was officially designated by the FCC.

> Also, I live in Winnipeg, so I don't know if the Canadian version
> will
> work in the US or Visa-Versa. Since I travel in both countries,
> hopefully it can be used in both countries.
>
That's a toughie. I've never actually seen a made-for-Canada GMRS
radio. If a radio model has been specifically made for the Canadian
market, it may not have been subject to FCC type acceptance. If the
radio has been made for BOTH markets, then it will have a US FCC ID.
If that is the case then it CAN be legally used in the USA.

BUT:

To be legally PERMITTED to use a GMRS radio in the USA, you need to
get an FCC license. Since you cannot legally GET a license, you
cannot operate a GMRS radio in the USA.

BUT:

IF your radio has a similar setup like in the US, where there are some
of the 500 mW FRS-only frequencies on the radio, then you CAN legally
use the radio in the USA.

BUT:

The radio has to have the FCC ID, showing it has type acceptance.

A lot if ifs, ands, or buts. Not being a smarty, just wading thru the
regs.

Part 95 is generally Citizens Band aka CB. But there was more to CB than you may remember.

Class A CB has become GMRS. It was around for many years before it finally caught on when 460 MHz equipment became cost effective.
Class D is the CB everyone thinks of at 27 MHz. Used to be ham 11 Meters. 23 channels then 40.
Class C was remote control like model airplanes
Class B was gone by the time I started in CB. Not sure what it was.

The GE Exec II is my favorite radio and I used one as my GMRS repeater.

The techs here might want to take a look at my page on this model:

http://rayvaughan.com/mastrexec2.htm

One thing... If the radio could exceed 50 watts as designed, I don't think it's type accepted for Part 95, even if you turn it down.

Didn't Class D have a license issued to those who used it. Way back when? My friend still has his original CB license. Kinda glad we don't need a license for Class D CB. Heck, I still have an old 23-channel CB radio with that "Delta" switch. Very efficient to use. But it sits on my shelf now.

If money isn't an issue, consider the Motorola 1250 or 1550 mobile with the separate switching power supply. All you see is the radio and a wedge type speaker that sits under it and acts like it's stand. The switching power supply is up to 3' away under the desk. Not too bad looking on the desk. We use them in all our fire stations. Lots of options in the programming. You can see the pieces here:

http://www.motorola.com/governmentandenterprise/northamerica/en-us/public/functions/browseproduct/transnavtwo.aspx?navigationpath=id_803i/id_1387i/id_2353i/id_1762i

I couldn't find a picture of the whole thing together, but you get the idea.

I've been looking - where specifically does it say
that a Canadian cannot get a US license to operate in
the US? Obviously and in this case, a US license is
not required of a Canadian to operate in Canada.

Typically from what I have seen, the only person(s)
not able to secure a US radio license (commercial,
amateur, etc) is a foreign agent, such as an embassy
employee. I do not believe that reciprocal licensing
agreements exist for GMRS between the US and Canada.

Well, I've waited and no one else has responded... I'm in agreement with everything you've said except the 200' limit on antenna tower. I believe that there is only the 200 foot limit without lighting as specified for Land Mobile service. I read the rules to allow above 200 feet, but with those same restrictions, FAA notification when required, and tower lighting as required by the FCC.

Here here,

I don't really see any specific regulation stating that they couldn't get one, although I found this in the Telecommunications Act of 1934 (am. 1996)

SEC. 308. [47 U.S.C. 308] APPLICATIONS FOR LICENSES; CONDITIONS IN LICENSE FOR FOREIGN COMMUNICATION.

(b) All applications for station licenses, or modifications or renewals thereof, shall set forth such facts as the Commission by regulation may prescribe as to the citizenship, character, and financial, technical, and other qualifications of the applicant to operate the station; the ownership and location of the proposed station and of the stations, if any, with which it is proposed to communicate; the frequencies and the power desired to be used; the hours of the day or other periods of time during which it is proposed to operate the station; the purposes for which the station is to be used; and such other information as it may require. The Commission, at any time after the filing of such original application and during the term of any such licenses, may require from an applicant or licensee further written statements of fact to enable it to determine whether such original application should be granted or denied or such license revoked. Such application and/or such statement of fact shall be signed by the applicant and/or licensee in any manner or form, including by electronic means, as the Commission may prescribe by regulation.

I dunno. Its Title 47 Section 301 for a license.

10399. Re: [GMRS] GMRS is not a hobby - Why?

I disagree, and would argue that GMRS could be considered a hobby.

A Hobby is defined as: An activity or interest pursued outside one's regular occupation and engaged in primarily for pleasure.

GMRS is outside my regular occupation, and I talk to people for fun on it. How is that not a hobby?

From: A10382
Topic: 10387 Message: 10400

The requirements for a US GMRS license are simple:

1) Not be an agent of a foreign government
2) Be at least 18 to be the licensee (although younger family members [relations listed in the regs] may be granted the right to operate on the licensee's authorization.
3) Have a US mailing address. The FCC does not care where you live.. only that you have a mailing address to receive FCC notices somewhere within the area regulated by the FCC (50 states or any of the US territories like Puerto Rico, Guam, American Virgin Islands, American Samoa, etc.),

I think that you may apply for a license of any kind thru the FCC, but when it asks for a US residence, that's where it may be tricky. You don't necessarily have to be a US citizen to apply, but you do need to have some sort of residence in the 50 states (Alaska and Hawaii have boundry restrictions - Line's A & C).

I'd say, if you are a Canadian, and you want a GMRS license, go for it. Pay the $85 and fill out the forms. But when they ask you for a US address, you must provide a US address, or call the 1-800 number and talk with a FCC agent with questions reguarding address problems within Canada and the US.

From: kvsp1160@aol.com
Topic: 10389 Message: 10403

Here's what I posted on another group about this:

I agree with your disagreement. (does that make sense?) This was just a discussion that started with someone stating something simple. And to get their reactions on this subject, has been more than satisfied.

The subject heading explains the entire message. Why is it not (or is it) a hobby? And so we've heard the different expressions.

While I'm not one of "those stuck-up, serious" GMRS people, I do tend to think that my service to my community via the repeater and help, is considered a valuable tool, and therfore I don't consider it a hobby. Although I am slightly thinking that it may as well be, I will stick to my original statement that it is not.

I'm still one of those "stuck-up" people that follow the rules and regs to the point, BUT I also don't track illegal users down. See what I'm getting at? =c)

So... in my opinion, it is not a hobby, while I do still have fun with it and enjoy helping others, like yourselves. But I did enjoy this discussion, and hope that we hear from others as well. That's why we have this group! Yep.

10406. Re: Emergency Channel?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-12 12:01:52 UTC
From: skyward4me
Topic: 10387 Message: 10406

Thanks to all of you that replyed to my message. I see that all execpt one of the responses got into the legalize of ownership and the like but ignored my main question about police monitoring of an emergency or "call for assistance" designated freq. or channel on GMRS.

If GMRS is useless for that perpose then I'm not interested anyway and those discussions, although interesting, are not necessary.

But let me clerify my situation.

I am a US citizen living in Canada (Permenent Residence Status). I am originally from St. Louis and still have family there. I could use one of there addresses if it came to that.

Canada has GMRS but no license is required for use in Canada. However you must register your radio with the government. Also it may be true that the power output for the Canadian version is less than what is allowed in the US, but I'm not sure about that.

I found this item on the web that offers some information on what Canada is doing.

http://www.cnp-wireless.com/ArticleArchive/Wireless%20Telecom/2005Q2WT%20GMRS.html

If I need a US license to operate one in the US, I don't have a problem with that. Idealy I would like to have a radio that I can legally use in Canada and in the US when on the road.

Thanks again to all,

Vince

Yes I have. A good source, but many are for ham.

A few in the repeater band listed are along the coast and thus in the wrong direction I need them. There does not seem (as posted) any in central NJ, Princeton area, or north of Philly/Moorestown.

well the best I can tell you is that most Police don't monitor the GMRS channels. BUT in a lot of city's there are groups like REACT that still does that. look on there web site (REACT"S) and I hope this helps.
The other thing in the US is that even most cell phones and even the ones with out service will call 911.

best I could do hope this helps. I guess also there is always ON-STAR.

10409. Re: [GMRS] Re: Emergency Channel?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-14 22:46:49 UTC
From: kvsp1160@aol.com
Topic: 10387 Message: 10409

Vince,

Some REACT groups still monitor CB channel 9/19, GMRS 462.675, and Amateur 446.500 (correct me if I'm wrong about the ARS). I'd suggest to go to www.reactintl.org and look up the REACT groups in the cities that you will be passing through, and ask them if they monitor GMRS. That should help you determine where the most reliable help is. Here in CA, even truckers on CB 19 still help stranded people on the highway, so it's another option (and another discussion on another group). =c)

I know that some police stations still use GMRS/CB, but mostly for counties and towns with a very small population.

Hi Guys,

I have two Midland 70-1526B mobile radios for sale. Both are in great operating condition, rated at 35 watts TPO, has eight channels, channel/monitor buttons, squelch on/off switch, and volume/on/off knob. Comes with mic, mounting bracket, power connector, and wiring diagram. Sold as is.

Asking $45 each or $80 for both, plus $12-$15 shipping via USPS.

Any questions, feel free to email myself.

10411. National SOS Radio Network - question

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-16 05:13:08 UTC
From: James
Topic: 10284 Message: 10411

Word is going around for Hams to monitor FRS Ch 1 for
emergencies. Where FRS CH 1 is also a GMRS Freq. It would seem
to me that this would conflict with FCC rules.

Sec. 95.183 Prohibited communications.
....
....
(13) Messages (except emergency messages) to any station in the
Amateur Radio Service, to any unauthorized station, or to any
foreign
station;

....

I would hate to have to justify the Emergency part.

I am a fairly new bubble pack GRMS user (WQBT311).
What does the expert GMRS users think about this?

I am just trying to keep it leagal.

James
WQBT311
KD5JBT

"National SOS Radio Network" ready to start, based on millions of
FRS "Family Radio Service" radios already in use plus 675,000 ham
radio operators across America.
"National SOS Radio Network" provides instant, reliable, emergency
communications for everyone. Designed to eliminate communication
breakdown as occurred in the aftermath of Hurricane Katrina. Ready
to go into operation immediately across America.

HARTFORD, CT (PRWEB) Oct 6, 2005 ☐ In the aftermath of Hurricane
Katrina, it's become clear that a major contributing factor to the
tragic loss of life was the near total breakdown of communication
systems. Once electricity, telephone, and cell phone services
failed, people were unable to let rescuers know of their dire
situations -- and died as a result.

What could be a simple, instant, and virtually zero-cost solution?

"Establish a National SOS Radio Network (www.NationalSOS.com)," says
Eric Knight, CEO of UP Aerospace, Inc. (www.upaerospace.com). "There
are millions of 'Family Radio Service' or 'FRS' radios already in
use by the public for camping, boating, and hiking, and there are
675,000 licensed ham radio operators in America -- people renown and

prepared for emergency communications. The output frequencies of FRS radios are easily received by the radio gear ham radio operators use daily. That's the magic link in this emergency communication strategy."

Knight went on to say, "The best part of a National SOS Radio Network is that it wouldn't require new laws or any new legislation whatsoever. It could go into effect, today. Once the ham radio community is made aware to listen for the public's emergency broadcasts on an FRS frequency, the national network will be up and running. It's as simple as that."

Knight has been a ham radio operator (KB1EHE) for over 30 years. To help spread the word about his idea to fellow hams, he said he plans to approach the Amateur Radio Relay League ("ARRL", www.arrl.org), the national membership association for amateur radio operators. Knight said, "The ARRL is a wonderful organization. They knit the ham radio community into a network that fosters education, technology experimentation, and emergency preparedness and assistance. With a positive word from the ARRL, the National SOS Radio Network could spring to life immediately."

FRS radios don't require an operator license, can be used by anyone of any age, and are available for as little as $14 at all large retailers, such as WalMart (www.walmart.com). FRS radios can broadcast 2 to 8 miles, depending on terrain. And there are ham radio operators in nearly every community in America. (To see how many ham radio operators are in any city or town, visit www.qrz.com/i/names.html and type in a zip code.)

According to Knight's proposed National SOS Radio Network plan, ham radio operators would rapidly relay the public's emergency needs to local and state authorities -- such as police and fire departments -- as well as to national rescue and relief agencies. As a natural extension of the National SOS Radio Network, all elements of government could also incorporate FRS radios into their communications systems -- for direct, immediate links to the public's emergency situations.

"In times of public crisis, the basic recommendation is for citizens to set their FRS radios on Channel 1 and transmit their emergency needs, and for ham radio operators to tune their receivers to 462.5625 MHz, the frequency that corresponds to FRS Channel 1," said Knight. "Specific operational details will evolve as the National SOS Radio Network gains awareness. To get the ball rolling, we've posted some operational ideas on a Web site we created: www.NationalSOS.com. We look forward to the ARRL's ideas and feedback, too."

"With the simple addition of a low-cost FRS radio to an emergency preparedness kit, a family in distress could literally reach out to the world -- and get the help they need," said Knight. "I can't

imagine a more powerful tool that could save so many lives."

"The National SOS Radio Network blends very well with the overall mission of UP Aerospace," Knight added. "It's all about broader public access for a variety of services. We pride ourselves on providing low-cost access to space -- particularly for the nation's college and university students. Likewise, through the National SOS Radio Network, the public can have immediate, life-saving access to emergency and rescue resources. It's truly a public service. We're not looking to profit from it. It feels great to play a role at the grassroots level of America's communities."

Although this practice is not illegal (FRS 1 is FRS one and requres no license) the sheer fact that you MIGHT get anyone is ludicrous and irresponsible to say. The range of these radios in the environments they would be mostly used in will be less than a mile. Not to mention the amount of noise generated by everyone on there in that time. The FRS was not designed for this practice and I would not risk my life or the lives of my family depending on a toy.

Hams should stick to ham radio and provide those services. How many are going to listen? Religiously? Will you be able to hear anyone? Will they be able to hear you? This idea is dangerous, simple as that.

I DOUBT THAT THE FCC IS EVEN GOING TO ALLOW THAT TO HAPPEN. CH1 FRS AS AN EMERGENCY CHANNEL??? NO WAY. IF THE DO TRY TO PUT THAT TO WORK THERE IS GOING TO BE VERY BIG PROBLEMS WITH THAT PARTICULAR CHANNEL ALONE. IF YOUR IN THE NY,NJ AREA THERE ARE SO MANY ILLEGAL STATIONS OUT THERE IT ITS ALWAYS DIFFICULT TO COMMUNICATE WITH SOME ONE. BE IT A BUBBLE PACK OR WHAT EVER RADIO YOUR USING. MOST OF THE THE PROBLEM IS IN MANHATTAN AND YOU HAVE STATIONS WITH 250W OF POWER. LAST I CHECKED I THOUGHT THAT AMOUNT WAS ILLEGAL AND NOT TO MENTION THOSE IDIOTS WHO WOULD JAM THE FREQUENCY MALICIOUSLY.

True, I wouldn't bet my life on it. But does it really hurt anyone to try to set something like this up? As a ham radio operator I have no problem listening to FRS1 in an emergency, and I think from now on I will dedicate a bubble pack radio to listening on FRS1 just as I have a radio listening to CB channel 9, during hours I am awake. Chances are I'll hear a lot of garbage, just as I hear a lot of spanish on CB 9 when conditions are right, but is that really going to hurt me any? I think not.

Bob,
The trouble might be on the other end. These bubble pack radios have such a short transmission range that the chances of someone hearing a mayday is slight except out in the planes states maybe. You might think that any chance is better than nothing but if anyone relies on it when a better option is available then it could casue harm.

If this is in fact true, it is unacceptable!
They (hams) don't even make use of
the frequencies they already have.

John

I have to admire your zeal.

However...

Any ham that wants to violate the rules is already doing so. Using the pretense of this plan to authorize ham operation on GMRS isn't necessary to someone who isn't following the rules already. As a ham, I haven't seen a ground swell on absorbing or pirating GMRS. Another dozen frequencies just above the 70cm band, who cares?

I can see numerous uses for FRS in "emergency" operations. There are two failure points:

1) The lack of a control station. Radio is more useful that cellphones when coordinating groups. The lack of a control station makes this

far more difficult.

2) No interface with Public Safety, mostly due to range limitations.

While the PRA has a lot on it's plate, one of the issues I'd like to see resolved is over equipment. I'd like to see rule changes which include as much equipment as possible, be it Part 90, 95 or even ham equipment which meets the technical requirements. Make each ham pay to have the radio "certified" by a local shop that his unit meets the technical requirements, for instance.

Perhaps the PRA could take the lead in developing a common frequency which hams, FRS, GMRS and Public Safety could all use in the event of an emergency. In my mind there should be such a service. If it means changing some rules in and around FRS, so be it.

Due to the license by rule and inexpensive buy in, FRS is currently the only service which is viable for neighborhood size operations involving many community members.

MURS would probably be a better base to start with, but the rules have made it unreachable. How a service could be set up which virtually eliminates all sources of equipment is beyond me. The FCC should be thinking about where the equipment will come from. The used market, where many of us do get our equipment, should have been considered. Even a five watt maximum limit, with consistent frequency requirements, should have been considered. Again, allowing hams to modify existing ham equipment should have been on the table, for interoperability between hams and license by rule folks. If ham equipment has been stable enough for CAPS and MARS, it certainly should be good enough for FRS and MURS.

I do agree that monitoring FRS without an ongoing localized situation is a waste of time. But it raises issues which are important.

There's a bit of a ramble, but I think it's all related, somehow.

Hal Curtis

I'm not trying to invade anybody's radio service. I am a properly licensed ham radio operator and a properly licensed GMRS operator. I'm not sure why some people have such a problem with hams on this group. If you've had a bad experience with one, then please allow me to apologize on behalf of the entire community for our idiots. Most of the ham operators I am aware of are friendly, helpful people, and I like to think I am the same way. I certainly don't want to put anybody off with my posts. I like this group, and I don't want to start a war between GMRS and amateur radio

That being said, I do agree that a bubble pack radio is a poor substitute for a proper radio when planning for an emergency. However, if you find yourself in an emergency situation and that is all you have handy, wouldn't it be nice to know that you could go to one channel that somebody might actually be listening to, as opposed to jumping around the channels trying to get help? True the range is so poor that you're probably not going to raise anybody beyond a mile, but on the plus side anybody who hears you probably won't have to go far to find you.

So if you're in San Antonio, TX, in the vicinity of 281N and 1604 and you have an emergency or just want to gab, I'm listening to channel 1.

Bob

Here's what I say about hams using GMRS:

If they have a GMRS license and follow all regs and rules for GMRS, then by all means, go for it.

However, if they use cross-link connections (ham TX's, GMRS RX's / GMRS TX's, ham RX's), exceed the 50 watts, or do not have a GMRS license (and use their ham license in it's place), then I will be putting my foot down. I can't do squat in other areas, but will take advantage of their callsign, and report them if I EVER hear them in my community. And that's a promise.

People using bubblepacks on GMRS without a license is one thing, but a licensed ham operator who knows the rules and breaks them, that is one I will not stand for!

Like I've said in the past, I'm not the type that tracks down illegal users, but this I will not tolerate.

If I've hurt anyone's feelings or thoughts on this, then take it up with me off of the group. Do not argue my thoughts on this group.

Subject: [radios4sale] GE Master II UHF REPEATER 4 Sale

Hello to the Group,

Anyone interested in GE Master II mobiles, converted to repeaters? I have 1 tuned on or around GMRS freqs (462.5215 or 462.550)., with built-in DTMF controller, with flat pack 50 watt duplexer (center BNC conn. broken, needs repair), and 1 UHF rcv. pre-amp. Items need to be picked up in the Fresno area, or I will meet buyer as far south as Visalia or north to Merced. Everything was working when taken from service, but may need tuning, etc. Looking for $250 cash for the package.

I have taken inventory of the items, as they were just pulled from storage. The repeater packages include the following. This is what I paid for the items:

GE Master II mobile w/duplex mods $65
(35 - 45 watts, I think)
Syscom 4533-2P UHF 6 cavity dup $265
(has broken BNC connector, may need factory repair)
NHRC- 3 - MII -00 DTMF controller w/vol & sq. pots $165 (makes unit fully mobile and self contained. No control head needed, or included)
Adv. Rcvr. Research P460VDG preamp $110
(12 volt Gasfet preamp)
Comm. Spec. TS64DS CTCSS decoder/encoder $55
(dip switchable encoder)

As you can see, I have about $700 invested in this repeater system. I will take $250 CASH. Prefer not to split items up, as these are already bargain basement prices! I do not have the 5C ICOMS for this repeater, however I have a couple EC's available. All items were working when taken out of service, but are sold AS-IS, with no warranty implied or intended. If you want to bench test items, bring your own test equipment, ICOMS, cables, load, etc.
I have a suitable 12V power supply & power/swr meter, which are not for sale.

Please contact me via email at rbjinvestigations@...

At 08:51 PM 11/18/2005, Craig wrote:
>If this is in fact true, it is unacceptable!

John wrote:
>There is now a serious threat to GMRS!

Guys, guys, guys!

A couple of notes...

1) What is being discussed is HOW trained Hams could help you and other GMRS / FRS users if you needed help in an emergency, not a general usage of GMRS by Hams for routine communications.

2) This would be an IDEAL way for FRS and GMRS users to communicate with the outside world during an emergency. The range of GMRS and FRS is SO limited, that the odds are low that anyone would help you in an emergency. Hams located close to you could hear you and RELAY your information to others using Ham frequencies that are capable for FAR great range.

3) Unlike the wild, untamed world of GMRS /FRS, many Hams are trained in radio theory and emergency procedures and use spectrum with much more discipline and skill than those on FRS / GMRS.

4) Current FCC rules ALREADY permit hams to use GMRS and FRS during an emergency WHEN life or property are in danger. SO, in effect, this is already in place. Some people are just asking for this to be formalized to provide even better discipline and more awareness of the resources that are already available.

5) THINK about what happened in New Orleans and Houston during Katrina and Rita. If you were trapped in your flooded attic and needed help, would you have wanted a HAM to use his or her superior receiving equipment to hear your calls for help and relay that to the authorities so that help would be more likely to be sent? IF you relied SOLELY on other GMRS / FRS users, the odds would be far less likely that you would have received help.

6) If there were a terrorist attack (nuclear, biological, chemical) or a hurricance/tornado/flood/earthquake that killed some of your neighbors or family member, wouldn't you want ALL the help that you could get?

7) AND LAST -- why not get your Ham license and find out what emergency communications is all about? A 10 year old kid near me got his license a few weeks ago. You can do this... and you will be glad when you do...

Good luck!

John, trust me on this... HAMs already have plenty of spectrum and they do not want to invade GMRS for ROUTINE communications. That's the LAST thing they want to do.

All they want to do is use shared FRS / GMRS frequencies to communicate with their neighbors, family members and friends (who do not have ham licenses) during an EMERGENCY.

Having Hams assist unlicensed, untrained and undisciplined users will do NO harm and is more likely to do a lot of good.

Plus, many of the most serious radio people who have paid for GMRS licenses are also Hams.

Most of the 30 or 40 million people who have purchased GMRS bubble pack radios and are using illegally them without a license are NOT hams. The people playing music and screaming profanities on FRS / GMRS are mostly NOT hams.

The polluted situation on GMRS and FRS will only IMPROVE as more Hams become active on these frequencies.

Have you ever listened to the ARES and RACES and SATERN and RED CROSS nets and emergency drills on HF (shortwave) or 2 meters or the 440 MHz amateur bands? GMRS users would learn a lot about emergency communications if they did.

Good luck!

Wow, I never thought of myself as an "invader". Maybe I should pull the three open repeaters I put up on GMRS down, retune them to ham, and restore the airspace to simplex only GMRS again? Most of the hams I know feel that GMRS is "below" them, that the only license worth having is earned, not bought.

I feel GMRS has a purpose, and provide repeaters to enhance communication on GMRS channels. I have provided three repeaters at good locations, for the free use of others. I take offense to be called an "invader".

10436. new repeater installation questions

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-21 22:18:01 UTC
From: Bob
Topic: 10436 Message: 10436

Well, here goes!

I just received my Vertex VX-7000 repeater and it's time to start setting it up.

The repeater will be installed on my own land as I had the good fortune to buy property on a good hill top. I'll be using a 70 foot pushup mast and a 6db gain antenna - plan on running 40 watts up a length of LMR-400.

Question about grounding: The antenna mast is welded to a 40 foot, steel shipping container that I use for storage on my property. Where I live in NW Arkansas there's no such thing as dirt - the "soil" is very rocky. From past experience I know that this antenna system will take frequent direct lightening hits. What kind of ground system would you guys recommend? Also need suggestions for a good lightning arrestor.

Looking forward to hearing your suggestions.

Bob Howle
Eureka Springs, AR

>radio misbehaving.

Unfortunately that is already happening in nearly every major city.

There is no practical difference between the 2-3 watt bubble packs
and a 5-watt radio when it comes to range and the ability to cause
interference.

UHF is line of sight. The distance will be the same for 3 watts or 5
watts. A GOOD 4-watt radio like an ICOM F21GM might be a little
louder, but will not propagate much father than a 2-watt bubble pack.

The cat is already out of the bag.

==========

Next time you're stuck in a snow bank, or lost in the woods, or trapped in the attic of your flooded house, or in your earthquake-collapsed garage, or sealed in your basement evading a toxic chemical incident, and the POTS and cellular networks are down, you're gonna wish that you would have supported a common emergency frequency that you could have used to call for help --- AND someone with some decent receiving equipment (other than a bubble pack) was there to hear you.

>kvsp1160@... wrote:
>Here's what I say about hams using GMRS:

Guys, I don't mean to flatter or insult anyone, BUT...

FCC rules ALREADY permit amateur radio operators AND unlicensed civilians to use whatever communications means are at their disposal for emergency communications WHEN lives or property are at risk. This also includes using FRS or GMRS to communicate with unlicensed civilians.

This DOES NOT mean that someone can run 1,000 watts on FRS or GMRS when they have a flat tire or their dog is lost.

HOWEVER, for 9/11 and Katrina-class disasters, Hams and others can ALREADY use FRS or GMRS to attempt to save lives. The FCC is not so onerous that they are going to prevent people from saving lives just to stay in compliance with GMRS and FRS rules, which have mostly been written by special interests.

SO... debate away in this little Yahoo group as much as you like.

The majority of licensed Hams are far more disciplined and educated about emergency communications than FRS and GMRS users and when the big day comes, you may hear them on those frequencies helping people in dire need.

And like I said earlier today, if you don't yet have a Ham license, why not get one? You'll find the process stimulating and very helpful if you have any interest in emergency communications.

Good luck!

10440. GMRS v Ham

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-22 01:33:51 UTC
From: Ray_Vaughan_99
Topic: 10440 Message: 10440

Okay folks, I've let the GMRS versus Ham stuff go on for a while. This seems to come up every few months. I'm glad no one has taken it to a personal level. But it's time to move on. We won't solve it here. The right medium is the FCC's Public Comment process.

I'm in both worlds, ham and GMRS license holders. And 461. And 800 MHz. My first hobby repeater was a 461.500 business repeater. The hobby part was putting it on the air and letting anyone use it since I owned the license. Yes, the license was more money. But it gave me the freedom to control who used my system. They didn't have to be family members.

Again, let's move on to other issues about GMRS.

>If that were their only intent, I would agree with you.

There is so much unused spectrum on the 144, 220 and 440 MHz amateur bands, that no Ham is going to want to "hijack" FRS/GMRS frequencies for any other use. The ONLY value in using those frequencies is to communicate with unlicensed FRS and licensed GMRS users in an emergency.

>They want to be able to use higher powered equipment to access FRS
>1, which is shared with GMRS.

You can already run 5 watts with a gain antenna on 462.5625 (channel 1, as you call it) if you have a GMRS license. In an emergency when lives are in danger, CURRENT FCC rules allow Hams to operate on that frequency to save lives or property.

> > Having Hams assist unlicensed, untrained and undisciplined users
> > will do NO harm and is more likely to do a lot of good.
>By being criminals themselves? I doubt that.

There is nothing criminal about a skilled radio operator saving a life no matter what frequency they use (permitted that the operation ceases when the danger has passed).

Good luck!

GUYS...

Give it a break.

Most of the "terrible" things that you are worrying about have already happened.

The worst problems with FRS and GMRS are caused by the USERS of FRS and GMRS who scream profanity and play rock and roll music over every FRS/GMRS channel, not by the Hams and professionals who use those frequencies OCCASIONALLY to save lives.

There are already "emergency nets" on FRS/GMRS frequencies in a number of major cities. At the risk of having you harass them, I am not going to say where they are. Some of them use channel 1 and others use different channels.

During the massive fires in Southern California in 2003 when 22 people died and 3,000 homes were destroyed, both Hams and citizens used FRS to coordinate emergency response to evacuate people and save lives. Did you know that San Diego is the 6th largest city in the USA and fully 10% of San Diego county burned in those fires?

AND... members of Northern California fire departments (firemen) used FRS radios purchased from Walmart to communicate with Southern California fire fighters. This was done because the radios in the Norcal fire trucks used different VHF and UHF frequencies than the Socal fire trucks. Normally, these trucks are stationed 500 miles apart. When the Northern fire fighters came south to help out, they had no other way to communicate with their Southern colleagues on the fire lines. Do you have any idea of what a wildfire 30 feet high and 40 miles across looks like? Have you seen the videos of the aftermath of Katrina? Have you ever experienced in a 7.1 earthquake? What do you think it was like at Battery Park in Manhattan on Sept 11, 2001?

When your town gets hit by a wildfire/hurricane/tornado/earthquake/tsunami/terrorist attack or other calamity and half your family is dead, maybe you will read back on what you have been writing here today and will see just how ridiculous and naive you have been.

Good luck!

Well thank you. I guess I missed the GMRS licensed hams being ok. Trust me, I come in peace ;-}

Really though, I seldom use GMRS except for storm watch. I have Icom commercial radios and use them for ham and GMRS. I don't use modified ham gear on GMRS, and only use NTIA compliant gear on MARS. So not all hams with modified gear use it illegally. Yes there are those types out there, but not many around here.

Happy Thanksgiving everyone!

See, that's the beauty of radio communication. If you can't hear their callsign, but can hear their signal, why not use a signal meter (field meter) and a directional (or yagi) antenna and pinpoint them down? Very easy to do. All you need is three points off of the direction of the signal, then draw your lines. When they cross, you found the general point, and then do it again at that area til you find the ones causing the problems.

I did something similar to that with a few bubblepack kids on my shared repeater system here. They're on for a few weeks after Christmas, then you never hear them again.

Yes. At that point, these folks are considered "GMRS operators" not hams, as they are properly licensed folks.

Absolutely!

If they even use their call sign, like an example of a criminal I referred to in an earlier post on this thread.

the kids accessed your repeater? or were on output?

on the local repeater here two kids maybe 18 or 19 yrs old were on the GMRS repeater they just showed up out of no where. and were following each other in 2 cars
by the way they were talking... " ok turn right" "ok I am turning right" "is that you behind me" etc.

I just asked them if they had a callsign, and then they were gone as quick as they arrived.....
they were in fact going through the repeater....

Topic: 10453 Message: 10453

So, I finally ordered a radio and now I'm just waiting for it to get here.

I have a few operational questions.

I understand how to ID myself if I'm using my radio; but if a family member is using it how do they ID? Same way? If I am talking to a family member can ID for the both of us or do we each have to?

If I am on an FRS channel can I talk to none GMRS users (IE FRS only) or are we only allowed to talk to other GMRS licensees?

Last one. If we are on FRS channels do we need to ID?

10454. Re: [GMRS] side band radio

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-27 23:10:23 UTC
From: kevin asato
Topic: 10421 Message: 10454

side band radio is a method in which the radio frequency carrier is effectively removed from the transmitted signal, leaving only the information itself. this allows the power in the transmitted signal to exist only in the voice or data payload of the signal. the result is a higher effective transmitted power of the signal. at the receiver, the signal is recombined with the rf carrier signal to recover the original information sent.

there are two modes of side band communications - double sideband in which the carrier signal is removed by both sideband remain and, the more common mode, single sideband. of the two, single side band is the most efficient as more power is dedicated into a single sideband of energy and conserves rf signal bandwidth.

single sideband is used on hf communications for amateur radio operators for voice and data communications as well as some cb operators. most cb is still conducted in AM mode. when listening to single sideband with a standard AM mode receiver, the signal has a donald duck quality to the signal the may be intelligible but generally not.

hope this helps.

Each person using the radio must ID. You could do something like
WXXX999 Unit 1, WXXX999 Unit 2, etc. "Unit numbers" are officially
"suggested" by the FCC in this regard.

>
> If I am on an FRS channel can I talk to none GMRS users (IE FRS

You can talk to anybody on FRS or the shared frs/gmrs freqs. If you
are on a GMRS only frequency, you can only talk to other licensed GMRS
users.

> Last one. If we are on FRS channels do we need to ID?

if you are on the frs-only channels, you need not ID. If you are on
the "shared" frs/GMRS channels, you need to ID.

I'm reading into this that you mean by ID as in a GMRS license call
sign.
One way to ID for each family member would go something like:
"WXYZ123 unit one to WXYZ123 unit two" or, "WXYZ123 base to WXYZ123
mobile". When ending your conversation, try; "WXYZ123 unit one (or
base, mobile, etc) clear". The other party in your conversation
should clear the same way.

>
> If I am on an FRS channel can I talk to none GMRS users (IE FRS
only) or
> are we only allowed to talk to other GMRS licensees?

FRS are non-licensed frequencies, low-power and you can talk all you
want to whomever you wish on FRS.
Any transmissions on GMRS frequencies should only be done by those
with a GMRS license. GMRS license holders may also use FRS
frequencies but unlicensed FRS users may not legally use GMRS
frequencies.

>
> Last one. If we are on FRS channels do we need to ID?

You may ID with whatever you like, but since FRS is non-licensed,
then there is really no need other than to keep straight who is who
with local 'unit numbers' when talking with several people on the air
at the same time (group at the fair or other event). Just remember
that FRS freqs. have output power restrictions.

Hope my attempts to answer your questions have helped in some way.
Good luck and welcome to the GMRS community.

Vince,

It depends on what you're using them for. Handhelds (also called HT) are great for all-around applications and a 5 watt radio will reach a repeater with no problem, if you have one in your area. Mobile radios are used for those who spend more time on GMRS (or other radio service) in their vehicles. Mobiles can also be used at home with a voltage converter (13.8VDC to 115VAC) and a base antenna.

As for what brand and model, I don't know about the model... But try either the Motorola, Icom, Kenwood, or even a Midland. Also read about the features of each radio, do some simple research on Google about each of them, and then decide on which one you think will fit your needs the most.

It's better to spend time on the research and then buy a radio that fits your needs, rather than worry about the price and then find out that the radio sucks later.

Also, if you don't have one already, you'll need a GMRS license. Only costs $80 for five years (about $16/year or $1.30/month). Pretty cheap if you ask me.

Hi Bob,

If there is a slight chance that you are able to drive a solid copper rod into the ground (5 feet or more), that's your best bet to protect yourself from lightening strikes.

The points that you'll need to ground your equipment (for high-lightning areas):
- antenna to mast
- mast to ground
- outer coax shield to ground
- equipment power connectors to ground (or equipment casings to ground if equipment does not have a three-prong plug)

You want to control the flow of the strike at the first starting point, which is the antenna. If that grounding fails, then follow the line to your equipment as suggested above. The quicker you allow the lightning surge to get to the ground, the higher chances you will have of protecting your equipment.

I'd also suggect to to disconnect the feedline (coax) if you're able to during a high lightning storm.

For coax connectors, try www.hamradio.com or your local radio shop. Even ARRL or other amateur radio organization will be of great help to you.

I think that it gets kinda confusing for that last question. If you have a FRS/GMRS radio and the other person had a FRS-only radio, and you're on channel 5, you don't need use your callsign. Even though you are using a FRS/GMRS shared radio, and the power may be greater than the other person's radio, as long as you hold a license and have it available for anyone who asks, you don't really need to announce your callsign on the FRS frequencies.

I think that this may be seen differently with others, but I don't recall seeing on the FCC site that you need to do this on FRS freqs. Only use your callsign on GMRS freqs.

Heck, if you want to use your callsign on the FRS channel, then go for it, but it's not really necessary as it's on a FRS frequency. And I rarely use FRS anyways, so I don't worry about it.

5 watts in the LA/OC basin into a repeater would cover
a lot of ground as many of the repeater sites are
located high on the mountains or hilltops around here.
There would be a few RF blackholes around where local
topography versus freeway passages manage to not even
allow a mobile unit to effectively transmit through
(405 around the Long Beach Airport comes to mind). The
other hole whould be the oceanside of the Palos Verdes
Peninsula as repeaters located there are below the
crest of the hill, facing the basin.

mobile vs handheld - it really depends upon your
preferences here. With a mobile, you could use the
extra power available to help you out in the rough
spots but the unit will not be as portable. I prefer
the mobile as the antenna is mounted out of the
vehicle (and away from my head), which would offer a
better chance at getting the signal out.

well assuming your on an FRS/GMRS freq. the FRS guy with his bubble pack is
putting out a whopping 1/2 watt
(doesn't need to ID)

but your putting out 5 watts. (above the FRS limits)
I would assume YOU need to ID.

John,

Thank you. As both a ham and GMRS user I personally strive to make the best of both worlds. I enjoy communications and like to further the interoperability between different users. This allows for cross training and education. Although I am only 30, I have watched over the past 20 years how CB has degraded to a very non-useful system FOR ME on a day to day practice, but I will also say that having used it during disasters it can also be a very useful tool. Who better to know road conditions than truckers? When the supplies need to get in, and there are situations like New Orleans where they are hijacking trucks that are in bound doesn?t it make sense to travel in "packs"? I have found over the past few years that each radio system has its own set of Pros and Cons, as mature radio enthusiasts we need to be aware of this and instead of focusing on the cons and "bashing" "them" we need to look at the pros and work together for a common goal. I have to agree (remember I said I am licensed on both GMRS and ham) I would not want to hear a local repeater (and we do not have one) tied up with a SKYWARN net run by local amateurs, but I do not see the problem with information being passed from one system to the other. In a true life threatening emergency (tornado, flood, hurricane, terror attack etc.) the best way for us to be an asset to the community is to work together, not against each other.

10469. 4 SALE ICOM F4TR NEW IN BOX 100 UNITS AVAIL

Yahoo group: GMRS (2005 — 2007)
Date: 2005-11-30 18:05:52 UTC
From: Scott
Topic: 10469 Message: 10469

Hi all,
I have a good business friend who is running a clearance on new Icom f4tr handie talkies. He has @ 100 units all are new. I have been doing business wiy=th Jim for 8 yrs. We have used him here at the sheriff's dept and I have bought several units from him over the years.

The web site for the radios is:

www.abeep.com

Look under clearance for the info on the eqpt. If you want to call Jim feel free to tell him you are a memeber of this group and a friend of Scott's. I don't think any of you will be unhappy if you purchase one. Jim also handles Kenwood and has several ltr towers in Illinois for both vhf and uhf. Need help , call Jim, he is really decent guy.

Thanks and have a great Xmas,
Scott

Okay, again, please move ALL communication about ham radio versus or
in cooperation with GMRS to the yahoo group set up for that purpose.
We have closed the subject here.

Never said anything about 5 watts for FRS. I can see 1 or 2 wattts for FRS/GMRS bubblepacks, but not 5 watts, unless it's from a commercial radio.

With that said, always ID on GMRS, but have it available for review on FRS.

And again to supprt my last email, I don't use FRS very much, if at all. So I really don't know if the FCC requires you to ID on that FRS channel/frequency.

The FCC Rules of Part 95.119 state the actions of the requirements for using your callsign for GMRS, but does not state the specific terms for use on FRS. Since the FRS and GMRS channels 1-7 on bubblepacks are shared and used as the same, it is my understanding that you, as a responsible licensed person using the radio, will have to make your own judgement on if you are required to use your callsign on those FRS channels or not; per FCC Part 95.119.

Not a legal requirement, but I guess to be on the safe side, sure.
Heck, ID when you use your cell phone if you really want to.

However, there are some FRS-only channels (8-14) where your license
might cause some confusion. GMRS users (like anyone) can only be
there under FRS rules.

For more information about GMRS licensees talking to FRS users:

Selling two Motorola T7450's with cradle charger.

Sell single radio or pair. Used once. Seer specs below.

Terryl Johnson
Titusville FL
TerrylJohnson@...

The most rugged, shockproof design, up to 8-mile range, crystal clear communication and NOAA Weather Alerts make the T7450 an ideal choice for outdoor sporting. Combining General Mobile Radio Service (GMRS) technology with Motorola engineering, this radio is the perfect companion on any adventure.Rugged Outdoor Styling The Talkabout T7450 features a rugged outdoor case and is designed to be one of the most advanced of the Motorola line of two-way radios. The rugged grips and holster-style carry case protect the radio during any outing. NOAA Weather on Demand** Weather conditions, tides and forecasts when you need them most□outdoors. A press of the button gives the information every outdoor enthusiast should know. Full-Featured Privacy The Talkabout T7450 has full 22-frequency capacity, and unlike our competitors, it has 99 Motorola exclusive privacy codes, so there are more channel combinations than ever. Our "Priority Scan" quickly helps you find the most private channel to give you a clear, interruption-free conversation. And when you enable the Talkabout's exclusive QT noise filter, radios from other manufacturers can't access your channel. This model features an accessory connector for headset operation, as well as a no-accessory hands-free capability. Companding The Talkabout T7450 has a special feature□"companding"□ a sophisticated digital technology that helps eliminate the static hiss between words. This technology not only extends the effective range of the radio but also delivers clearer transmission quality. Power to Spare Just charge up the NiMH- powered rechargeable units.

10477. Pryme PR-460 Radio's

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-02 02:54:27 UTC
From: Gary
Topic: 10453 Message: 10477

How many of you purchased Pryme PR-460 radio's for use as GMRS radio's? How many of you still use them on GMRS? Did you know your radio is not Part 95 certified and can not be used on any GMRS/FRS frequencies.

If any of you have been watching the thread on the GMRS Web Magazine board? It seems that a discussion came up on their regarding using Part 90 radio's for GMRS. It was mentioned that the rules state that a GMRS radio HAS to be Part 95 certified. Then it was pointed out that, according to the FCC ID number (IQJC420N), on his PR-460 that it was Part 90 only certified and not Part 95 certified.

So he sent an email to the FCC inquiring if his PR-460's were certified for GMRS use. The reply he received back, in part, was posted on the board. It read "Equipment bearing FCC ID # IQJC420N is for use under Part 90 of the FCC rules. The equipment has not been certified for use under Part 95." It would appear that all of us who brought those PR-460's were sold radio's that are not legal to use.

Comments?

they are legal for gmrs becuase when pryme sold them. They sold them
programmed for gmrs use. Bob leef used to
sell them. You could also get them from any ham dealer including HRO at
the time which was about 4 1/2 years ago.

just because you program a radio for GMRS does not make it ok and be
accepted by the FCC for part 95.

It would be like if I programmed a Vertex 6000 for it, the radio would work
but this is a 100 watt mobile and since the freg is in it does not make it
accepted to the FCC under 95.

All I can tell you is that if you take the FCC ID number supplied and look at it in the FCC data base, you will see that it is only Part 90 certified. GMRS radios have to be Part 95 certified, which the PR-460 is not.

If any of you know the correct person at the FCC to contact and ask regarding this, please do. I asked for and received a copy of the email the FCC sent this person. I can forward that copy to anyone who would like to see it. I believe it has an incident reference number on it that can be used to reference the FCC back to the question(s).

The point is that they were certified for use in the gmrs band and that is the way that pryme marketed and sold them.

they also slod them as business band radio's too...

ken n1dot

they also have been out of production for at least 3 years now.

From: Ray_Vaughan_99
Topic: 10453 Message: 10486

If someone has a spec sheet or anything that shows that they _were at one time_ Part 95 Accepted, that might be a good thing to show the FCC if you're ever inspected. Even if Pryme was wrong, it would show that you did your duty by buying a radio you believed to be Type Accepted under Part 95.

I'm not a lawyer, but it would seem reasonable that this would show your intent to obey the law.

If you assumed type acceptance just because of the way they were programmed, that's going to be a weak argument. If they were sold clearly documented as GMRS, that might help you.

Believe it or not, the FCC has been known to be reasonable.

10487. Help programing FT4R

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-04 01:30:12 UTC
From: Geoff
Topic: 10487 Message: 10487

Hello,

I just got my FT4R and I am trying to program it and I'm getting an error while trying to read the radio. I was hoping maybe someone could help me figure out what's going on.

It starts reading and I get the "Radio SN" and the "PassPort ESN" to display but then I get an error saying to make sure the radio is connected and all cables are secure.

The exact error is: "No response received from radio. Please be sure radio is on and is connected to the programming cable. Also, Please check that the programming cable is plugged into the selected COM Port."

I've done all that. So I'm at a loss.

Might I have been sent the wrong cable? It only plugs into the Speaker jack.

Do I need the Advance Dealer to Factory Tech passwords? As a matter of curiosity what are those passwords?

Just wondering what I am doing wrong.

Geoff

10488. Maxon SM-4450 UHF Mobiles for sale (New)

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-04 02:31:34 UTC
From: w9nessar
Topic: 10488 Message: 10488

Hello To All,If anyone out there is looking for the Maxon SM-4450 16 channel 40 watt mobile unit for GMRS, I have located 8 of them brand new in the box on the Northeast side of Indianapolis,Indiana.I just purchased my Maxon on Friday 12-2-05,The gentleman who sells radios used to be a Maxon Dealer and he held back 10 of them thinking they were going to sell.A lot of users have gone on UHF went to 800 and 900 Mhz Trunking systems in the Indianapolis area and he would like to sell them,If anyone would like to buy one of these new radios in the box programmed ready to go Please contact me at my e-mail address which is W9nes@... and I will get you in touch with the proper contact person. I paid around $160.00 for my radio which is brand new and everything was with the radio including the mobile mic, mounting bracket, owners manual,etc.I hope to help someone out there who is looking for a radio to use either as a base or a mobile unit.Thanks, Best Requards Tim DeLong KAF3207, W9NES

10489. Re: [GMRS] Pryme PR-460 Radio's

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-04 08:59:32 UTC
From: kvsp1160@aol.com
Topic: 10453 Message: 10489

The radio itself is not Part 95 certified. That I can understand. The reason is that it can be programmed for the UHF band (440-470 MHz) and may have options added to the radios for it's individual use. However, today these options or radios are no longer available through Pryme, but only through private dealers or individuals.

If you are using the radio on GMRS-only frequencies, and EVERYTHING within and on that radio that is currently in use with those frequencies are following FCC's Part 95 rules, I believe that would make your operations on the radio legal under part 95.

Now if you add other frequencies that don't operate under GMRS, then your frequencies and operations are not Part 95 compliant.

So I guess I see it as this:

- The PR-460 and accessories itself (physical equipment) are Part 90 accepted.
- The frequencies and operations that are used within and on the PR-460, under GMRS rules and regs, are Part 95 accepted.

It depends upon how you look at it and if you are really following the FCC rules to the exact point. I will say this; I was told when I bought my PR-460's that they were covered under Part's 90 and 95. HRO used to sell them (PR-222 for ham & PR-460 for FRS/GMRS), and was very popular in the GMRS community a few years back when they were still in production. I still use them and I do not plan, nor will I even consider combining them with ham or other frequencies in the future. Seperate radios, seperate services.

10491. How to deal with PL tones on a F4TR

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-04 22:50:58 UTC
From: Geoff
Topic: 10491 Message: 10491

I figured out my programing issue that I posted about earlier.

However, I have a question. How do I deal with PL tones. With repeaters I understand there won't be a need to change the PL ton a lot.
When it comes to working on a simplex I can see a need to change PL tones on the fly so you can share a channel or talking to someone else who has different tones programed then I.
Is there a way with the F4TR to deal with this? To either field program the radio to deal with this issue. Or what are my other options.
As of right now I have all GMRS and FRS channels programed in with no tones; a total of 30 channels. So making each PL / frequency combination a memory starts getting prohibitive; especially when I want to have some space left over for repeaters.
I'm just looking for my options to deal with this while I still have a chance to send the radio back and maybe find another radio that is possible to do what I want.

Geoff writes: "As of right now I have all GMRS and FRS channels programed in with no tones; a total of 30 channels."

Geoff, the answer is simple - you may not use the F4TR on FRS channels. It is not a type accepted radio for FRS; among other FCC requirements for FRS radios, the antenna may not be removable. That alone disqualifies the ICOM IC-F4TR.

I have seen sooo many radios that are not part 95 certified on not only GMRS but on Business Bands that I am no longer surprised that radios get sold with the statement that they are GMRS etc. All you have to do is look on Ebay and you see overseas production of GMRS radios being sold. Does that make it right? Of course not, but for the person that bought the radio they will use it until ordered to stop! I myself am using Midland 16 Channel portables that most people don't even know what they are (they are Uniden spu51kt's) but with a Midland number on them and certified part 95,90. I have seen people with the Jong, Nanophones and other Asia made radios and they have all sorts of features like keypad programming etc. BUT no they are not certified anywhere. IF the The PR-460 is part 90 certified at least it has something! Does everyone go around checking each others radios? Well just had to put in a few words. Oh and if its hard for individuals to figure out what radio is what even this review by Popularwireless on the PR-460 GMRS radio can be wrong http://www.popularwireless.com/gmrspryme.html . Thanks

Will take a copy if you're still willing, Ryan. Email is fine
waltermitty01@....
Didn't realize that the PR-460 is no longer being made until i read it
here. Though
not perfect, they're pretty nice and cost effective. I have a pair of
DTMF equipped,
as well as pair w/o, one VHF and one programmer (if anyone needs help).
Matter
of fact, just finished PDFing the manuals.

Except if the FRS channels are the interstitial frequencies with GMRS (FRS Ch. 1-7). In which case falls under GMRS rules and Part 95A (part 95/subpart A). But if he has the entire 14 channels, then yes, that is a definate problem and an absolute no for a radio with a detachable antenna. Also, make sure that when using those FRS channels, you are not exceeding 1 watt.

...snip...

Just because a consumer/user programs non-GMRS frequencies (ie amateur, public safety, business frequencies) into a radio, does not invalidate its part 95 certification. The build-up of the radio (frequency stability, emissions, no user accessable, as in front panel, frequency determining features, etc) along with just following the steps to certify the radio (filing the paperwork) are what make or break certification. Certification is a process/document that does just that, certify that the radio in question meets the technical requirements of the service in which it was applied for.

In my VHF radios, I have business frequencies, ham frequencies, and also some government frequencies (National Park Service) which are NTIA regulated. Having these "non-part 90" channels programmed in the radio doesn't invalidate the part 90 certification. Same holds true for GMRS radios, assuming that they are certificated for part 95 to start with.

To clarify something. yes, I do have the FRS only channels programed into a radio that is not type'd for FRS. Will, I remove them? I'm thinking about it.

However, let me explain why I am doing it. I am an EMT (as I'm guessing some of you maybe). However, I am in a unique system where I am the sole EMT for an entire town (which has 2 agencies - in other words I am an EMT for 2 agencies at the same time). The reason for this is one of the agencies counts on using FRS for a back on communication as well as a back channel was to talk to each other. The majority of the time it's no big deal but there is the occasion where I need it to talk to my crew either when the event is large or our proper radio is not working.

This is the only time I plan to use it in a non-type accepted way.

While still not right it's slightly better then just doing it because or be someone we all hate.

Again, nothing is written in stone.

Geoff

Sorry Geoff I just have too...
I have to clarify, the use of FRS in this situation is for members of this partiular agency to chat and opperationally on scene like backing up the rig and things like that. It is just to do thing that are not appropriate on the public safety radio. But many of the members of area agencies Fire & EMS are using frs for chating and such, and a few are moving to GMRS.

Regardless. your still breaking the rules.
Even if you were 'King Tut' it doesn't
matter, rules are rules. Do it correctly or
Stay Off!!! Thank you for your support.....

That's alright Mitch. You clarified things.

Just to CYA. I have removed the FRS only channels from my radio.

I will add. After talking with some officers about the use of FRS among the things that Mitch mentioned they are for other operational and "larger" scale or in general back channel issues. You go this way I'll go that way we'll radio when we find the patient or get lost or other things of that. Personally I think they should get a public safety frequency and program it into radios and all the other agencies that need it will put it in and everyone will be happy. But I don't for see it happening for many reasons.

Well, as far as I am concerned this topic is kinda beat to death.

Geoff

Mitch Donovan wrote:

Both links work but I haven't figured out how to get to the info
shown on the first link by using the search function given on the
second link.

The information is very interesting. The manufacturer claims are so
bogus. It is nice to be able to find real values. Has anyone compiled
ERP values for various GMRS handhelds?

Topic: 10508 Message: 10508

Hi everyone. If you need an inexpensive repeater, I have one here. Motorola R-100, 10 watts, DPL. I will also add a Sinclair flatplack duplexer. Put an antenna on it and you're on GMRS 462.575-467.575, plug and play. $425.00 firm plus shipping. I'm not really in a hurry to get rid of it but if you want it for that price, its yours. I cannot program or retune it, you'll have to go to a shop.

You may email me about it at easa700 at yahoo dot com

Thanks

Sorry guys but I have to say this is a battle that ended long ago. FRS has gone to the dogs. I saw this twice today at Wal-Mart (sale on "10 mile radios") and at breakfast today. The local Cracker Barrel here in town has given most of their employees FRS HT's for their in store comms. That's probably going out to all stores.

Pretty web site though. My compliments to the web master!

10512. GMRS Usage by Government Agency

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-12 18:04:59 UTC
From: skagitjim
Topic: 10512 Message: 10512

Greetings,

A local (county) government agency will be conducting an emergency drill in the coming months, and I know they are planning to use GMRS radios for communication. I wish to know the ramifications of this considering that the users (local government employees) will be mostly, or entirely, unlicensed for GMRS usage. Could the agency be fined for this, or could individual users be fined?

Thanks,

Jim Johnson

Business can legally use FRS for their communications. Our concern is
unlicensed use of GMRS freqs. Of course, the PRA is much more than
helping initiate enforcement action.

Some cities and counties still have active, valid GMRS licenses. Anyone that works for the licensee can legally use radios under their license. They're grand fathered and can't do much to change the details of the system. But don't assume they're doing this unlicensed. Just one I'm familiar with:

Callsign: KAB4510
Licensee Name: CORAL GABLES, CITY OF
Radio Service: ZA
Address: 2801 SALZEDO ST
City, ST, Zip: CORAL GABLES, FL 331340000

If you want to look up your county or city, start here:
http://svartifoss2.fcc.gov/reports/index.cfm

If they aren't operating under such a license, then I suspect the unlicensed users could be fined.

You are looking at one piece of the puzzle. There are many other issues that need and can be addressed other than bubble pack radios. There is nothing wrong with a business using FRS radios for their comms, provided they stay on FRS. Again, there are many other issues which need addressing relating to repeaters, high profile unlicensed usage and rule procedures.

The battle never ended long ago...its still going.

Chris

Speaking of bubble-pack radios, does anyone know of a chain that stocks good-old 14 channel 500 mW FRS-only radios? Or is it just up to eBay now...

I got a pair of Moto T5420's with charging base for my birthday a few years ago and wish I knew of a good source to refer people to get other 14-channels so they don't have to deal with restricting their use on 22-channel combos, or choosing between a unlicensed use fine or a license fee.

Yes. No one is permitted to use GMRS without a license. Go to this
link, to file a complaint, fill it out and mail it to the FCC.

You do not need to be a PRA member currently to use this form.
(although, we'd like to see you join, if you aren't a member) Email a
copy to the address provided also. The FCC and the PRA will act on
this form.

Best Buy, Target, K-Mart and Wal-Mart use FRS radios for their in-store needs. Everywhere you go, you hear those annoying little bleeps. Kinda makes me wanna listen in or even chat with them... But I'll be nice to them. I mean FRS is free and all you have to say is that you're "on the side"...

...Won't that wake them up!

In terms of "legal use" use by business of the 14 FRS channels,
it is noteworthy that every radio I have checked at Radio Shack,
Wal-Mart, Office Max, Staples and Target are all 22-channel models.
That is to say, Channels 1-7 use more than 500 milliwatts and so require
a GMRS license to use. Channels 8-14 are strictly FRS and are no problem.

I can find no blister-pack retail outlet selling 14-channel FRS-only radios in
the Orlando FL are.

So my experience is that a business using FRS channels 1-7 are probably illegal,
and no one cares to enforce it.

10521. Linking GMRS Repeaters

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-13 00:20:09 UTC
From: Bob Gass
Topic: 10511 Message: 10521

I think this may have been discussed before, but what is the FCC position on linking GMRS repeaters. I've heard people doing something like echolink and also doing some kind of full duplex linking via radios at the sites or at a base station between sites. I know at one time there was some kind of GMRS link software for internet use but that seems to have gone away.

I'm also concerned about some local repeaters that "beacon" every so often when the repeater is not in use. Isn't that prohibited also?

I have been told that realistically there is no enforcement of any rules on both FRS or GMRS and that basically they both are quickly evolving into the "CB of a new generation!" If that's true, then the marketing and packaging that you speak of, (combining of both services in 1 radio) is probably a major contributing factor of that evolution.

Let me check out Best Buy here and see what channel they're on. I'm very curious if they're using the shared channels or not. Boy would it be nice to bust a major company and... Aw... anyhow, I'll still see what they're on. I'm not going to take my time out and bust every store I hear, but am very interested to know how wide-spread this problem is in my area.

Here in CA, we are known to have problems like this. I wish we weren't marked or tagged with that kind of thought, but sometimes for those folks down south, it's true everyday. Up here in Nor Cal, it's quiet, but we get our share once in a while. Maybe if I had some action up here, I'd know exactly how y'all are feeling. But at least I'm thankful it's quiet.

Now after Christmas... That's a different story!

That will be interesting. So all the Yahoo's (I don't mean Yahoo group subs) will be able to join in on the drill with their $10 bubble pack radios that they got at WalMart.

When the drill people start using it, they will add their two cents in plus, as a bonus, demonstrate all of the neat sound effects that their cheap radios can make!

Good luck.

Sean

Subject: [GMRS] GMRS Usage by Government Agency

Greetings,

A local (county) government agency will be conducting an emergency drill in the coming months, and I know they are planning to use GMRS radios for communication. I wish to know the ramifications of this considering that the users (local government employees) will be mostly, or entirely, unlicensed for GMRS usage. Could the agency be fined for this, or could individual users be fined?

Thanks,

Jim Johnson

From: jt_johnson@comcast.net
Topic: 10512 Message: 10525

I spoke with the drill coordinator about this and convinced him that it was a bad idea to use a GMRS frequency during the drill. His plan now is to use FRS for the drill and GMRS if there is an actual emergency (emergency in this case means any large-scale disaster or act of terrorism in which many lives are at risk).

His understanding is that during an emergency, anyone can use any band available to them whether they are licensed for that band or not. I don't know whether that's true or not--any comments about that?

Thanks for the responses.

Not permitted in any sense. Use of Echolink is also forbidden under
most cases. Use of any linking via the telephone system is forbidden.
Linking of any GMRS repeaters is forbidden under all circumstances.

Theoretically, linking GMRS user via Echolink, IF they use Satellite
internet is *technically* legal, although unethical.

Totally forbidden. Known as "channel camping" Violates the "shared
use" provision of the FCC regs.

Jim writes: "His understanding is that during an emergency, anyone can use any band available to them whether they are licensed for that band or not. I don't know whether that's true or not--any comments about that?"

Not true, Jim. Only in case of dire emergency - protection of life - and no other means of communication available is it permissible to "use any band available" regardless of license.
In other words, that agency had better be prepared to justify their actions to the Federal Communications Commission in the strongest possible manner and be prepared to pay some very hefty fines (up to $11,000 per occurrence PER DAY) plus loss of all licenses that they may legally have been issued should the FCC disagree with the practice of transmitting where not licensed.

Please call me here in Vancouver, Washington to discuss this further.

Can you cite a rule please? I'm with you as far as the use of GMRS frequencies and the "Public Switched Telephone Network" but I don't know where Satellite, microwave and non-switched services are banned.

Seems to me I read in, I believe Popular Communications, were the military was going to use FRS/GMRS radios in Iraq but couldn't because it was said that they couldn't use civilian radio frequencies. There was a shortage of radios for good communications when times got rough, and then there was a drive to send CB's over. So, who knows.

As for the using GMRS radios on FRS freqs, my cheap Midland GTX300 have power settings for channels 1-7 but default to half watt on 8-14 as required by the FCC. You can't change it. Does that mean you can use higher wattage on 1-7? Looks okay to me.

Hey guys,

Unless the FCC has updated their "Part 95" site, I can't find the rule that states that there is to be no linking of any kind.

Bob,

I will say no from past experiences and past discussions for both of your questions. But this is just one answer out of the entire group. Let me send your question to some of my friends for help on this...

John and Ray,

I can't find the rules on the FCC site!! I sent our question to our other GMRS group for a second opinion and help. I know that you can't add any equipment that uses telephone networkings and the such, but frequency linking doesn't seem to come up as a problem. As in having your repeater TX on 467 to another repeater on the same frequency. Can be done and is legal as the FCC also doesn't state that in their Part 95 rules. Here's my resources direct from the FCC site: http://www.access.gpo.gov/nara/cfr/waisidx_04/47cfr95_04.html

If you connected GMRS to the Internet, someone along the line might
use a dialup modem, and thus you would then be connected to the PSTN.

Doesn't matter if you're licensed or not. Unless your life is threatened (physically, not verbally), this guy has no right and is absolutely unlawful if he thinks he can use GMRS without a license for "emergency" applications.

If you know him personally, talk with him and have him switch to a business band. Save him and us the hassle. If they are a government agency or not they should realize what the word "law" means, right? Just because they have a higher authority in the world, doesn't mean that they can over-rule the FCC rules and regs for radio communications.

With that said... Stay on FRS for your tests, and if you have a emeregncy, use a business band or cellphones.

How would you interpret the following?

95.141 Interconnection prohibited.
No station in a GMRS system may be interconnected to the public
switched telephone network, except as and in accordance with the
requirements and restrictions applied to a wireline control link (see 95.127).

Dig through part 95 and you may find something regarding linked GMRS repeaters.
It has never been done, as far as I know.

On the other hand, the DingoTel people are connecting FRS radios to
the Internet.
http://www.dingotel.com/2way/index.asp

I queried the FCC on this about six months ago and they replied that
they were "looking into it."

Dingotel is still selling radios via Amazon, BestBuy and others.

Good luck!

>I can't find the rules on the FCC site!!

The 95.141 rules as written are not entirely clear (see below). But I would guess that the FCC would interpret them to say that "Interconnection prohibited" means that repeaters cannot be linked. There are no linked GMRS repeaters anywhere in California that I am aware of, and considering the technology available in California, you would think that it would have been done here by now if it were legal.

One way to find out is to ask Riley -->> <Riley.Hollingsworth@...>

Or Bill Cross -->> <William.Cross@...>

95.141 Interconnection prohibited.
No station in a GMRS system may be interconnected to the public switched telephone network, except as and in accordance with the requirements and restrictions applied to a wireline control link (see 95.127).

How would I interpet? No Autopatches. No connecting GMRS users to someone on a telephone line. I really don't buy the 'since no one else does it therefore it must be illegal' opinion.

How the FCC defines Interconnect elsewhere in Part 95. I think the last sentence covers linking.

95.1313 Interconnection prohibited.

MURS stations are prohibited from interconnection with the public switched network. Interconnection Defined. Connection through automatic or manual means of multi-use radio stations with the facilities of the public switched telephone network to permit the transmission of messages or signals between points in the wireline or radio network of a public telephone company and persons served by multi-use radio stations. Wireline or radio circuits or links furnished by common carriers, which are used by licensees or other authorized persons for transmitter control (including dial-up transmitter control circuits) or as an integral part of an authorized, private, internal system of communication or as an integral part of dispatch point circuits in a multi-use radio station are not considered to be interconnection for purposes of this rule part.

That's for a physical hard-wired line to interconnect two or more repeaters. If you were to link a repeater by means of linking via frequency (RX on 467, TX on 462, TX also on 467 to another repeater). It can be done by connecting more than one TX module to your radio on older radio systems. This allows the user to bypass the means to use wired ocnnections or other satellite connection within the phone system.

95.141 is referring to land lines via telephone networks and the such. Does not state linking to another repeater or system via frequency transmission.

Good points, Ray.

As you probably know, VHF and UHF amateur repeaters are linked in various ways... microwave, 1.2 GHz links and VoIP/Internet.

Since there are no apparent bans on those methods in Part 95, perhaps you or someone might want to link together a couple of GMRS repeaters and see what happens.

You could always ask Riley in advance as to whether his department will have any objections -->> <Riley.Hollingsworth@...>

The truth is that Part 95 is so bureaucratic and so vague in some areas, people often don't know what they can do and cannot do, unless there is a specific relevant reference.

Good luck!

No relationship really, I was just commenting on how the FCC is just another typical bloated government bureaucracy. They will charge (or tax) you to death and give you nothing in return in the way of service. The next time that you owe them money why not wait 6 months and tell them that, "You're thinking about it!"

Actually, license fees don't have much to do with the FCC either. As I understand it, the FCC gets a budget from Congress. They run the operation and provide service based on the budget. Your license fees and other people's fines go straight to the general fund, not to the FCC. If everyone with a GMRS radio applied to the FCC tomorrow for a license, they wouldn't get one more dime of money to help us.

'Tis against the rules for a repeater to transmit on the *.467
frequencies....this rule is:

PART 95--PERSONAL RADIO SERVICES--Table of Contents

Subpart A--General Mobile Radio Service (GMRS)

Sec. 95.29 Channels available.

(a) For a base station, fixed station, mobile station, or
repeater
station (a GMRS station that simultaneously retransmits the
transmission
of another GMRS station on a different channel or channels), the
licensee of the GMRS system must select the transmitting channels or
channel pairs (see Sec. 95.7(a) of this part) for the stations in
the
GMRS system from the following 462 MHz channels:

462.5500, 462.5750, 462.6000, 462.6250, 462.6500, 462.6750, 462.7000
and
462.7250.

(b) For a mobile station, control station, or fixed station
operated
in the duplex mode, the following 467 MHz channels may be used only
to
transmit communications through a repeater station and for remotely
controlling a repeater station. The licensee of the GMRS system must
select the transmitting channels or channel pairs (see Sec. 95.7(a)
of
this part) for the stations operated in the duplex mode, from the
following 467 MHz channels:

467.5500, 467.5750, 467.6000, 467.6250, 467.6500, 467.6750, 467.7000
and
467.7250.

I don't think I would violate this one!

Bob, GMRS WPVV845, Amateur KG4WAD, LMRS WPXC892

Hello guys. I've been lurking on this list for only a few weeks but have to chime in here.

The regs state that repeaters may transmit only on 462, not 467:

Sec. 95.29 Channels available.
(a) For a base station, fixed station, mobile station, or repeater station (a GMRS station that simultaneously retransmits the transmission of another GMRS station on a different channel or channels), the licensee of the GMRS system must select the transmitting channels or channel pairs (see Sec. 95.7(a) of this part) for the stations in the GMRS system from the following 462 MHz channels: 462.5500, 462.5750, 462.6000, 462.6250, 462.6500, 462.6750, 462.7000 and 462.7250.
(b) For a mobile station, control station, or fixed station operated in the duplex mode, the following 467 MHz channels may be used only to transmit communications through a repeater station and for remotely controlling a repeater station. The licensee of the GMRS system must select the transmitting channels or channel pairs (see Sec. 95.7(a) of this part) for the stations operated in the duplex mode, from the following 467 MHz channels: 467.5500, 467.5750, 467.6000, 467.6250, 467.6500, 467.6750, 467.7000 and 467.7250.

I believe you could connect two repeaters but not by retransmitting on 467.

Wayne

10549. Just as a point of interest

Date: 2005-12-14 21:20:17 UTC
From: Lake Hodges Radio
Topic: 10511 Message: 10550

Wayne... good observations. But I have these questions...

1) If a repeater operates normally on a channel pair (let's say .5500 just as an example), could that repeater also send out a low power "control" signal on the input channel of a different pair (let's say 467.7000 as an example)? To elaborate, the repeater would listen normally to 467.5500 and repeat what it hears normally on 462.5500. It would ALSO send the same signal via low power (5 watts or less) on 467.7000 through a high gain yagi aimed at a second repeater which is listening to 467.7000 and repeating on 462.7000. Assume that you would have one or more duplexers that would make this work from a technical standpoint. Would the low power signal being transmitted on 467.7000 be considered a "control station" as defined in Part 95.29(b)? -- see far bottom of this page.

2) Having asked that question... Are licensees not required to LISTEN to the frequency on which they are transmitting BEFORE they transmit in order to avoid causing interference to other licensees? This would mean that ANY linked repeater system would require that all HTs and mobiles and control stations would have to be able to hear the input frequencies of all linked repeaters to fulfill this requirement, would it not?

3) This is not a big deal and has been solved in linked repeater systems used by hams. Look at the WIN System here in California as an example (http://www.winsystem.org/). This system operates on the 440MHz band. In theory, much of what is being done here would also work on 462/467 MHz. The exception to this MIGHT be the use of 1.2 GHz links between repeaters and the use of VoIP for people connecting in from Alaska and Australia. If someone uses a dialup modem to access VoIP, they would technically be using the PSTN which is prohibited in Part 95.

4) If amateur systems use 1.2Ghz to link repeaters, can GMRS repeaters be linked in a similar way? How would you do that? This would almost have to require that a repeater transmits on at least two frequencies, one as a repeater and the second as a control station. Is this doable?

5) I support your vision that GMRS repeaters can be linked without violating Part 95. But I have never seen it done. Why not? Did the FCC intend to prohibit linked GMRS repeaters when it wrote the recent revision of Part 95? Or did they leave the door open for creativity here? Has anyone asked the FCC this question?

More in a minute...

10551. Linking GMRS Repeaters Legally / Part 2 or 2

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-14 21:39:13 UTC
From: Lake Hodges Radio
Topic: 10551 Message: 10551

Another thing I am wondering is why someone would want to link GMRS repeaters?

1) Do they want to link distant cities? Example: LA and San Francisco, New York and Boston?

2) Or do they merely want to extend the range of an existing GMRS repeater by 100 miles or so?

Number 1) above would probably require discrete RX/TX repeaters in those different cities linked via some means other than UHF line of sight signals. Leased lines, satellite, VoIP, etc.

Number 2) above might be achievable without needing two repeaters with two transmitters.

Here is how:

-- Imagine a traditional GMRS repeater on a 6,000 foot mountain in Colorado or California using a defined pair such as 462/467.575. If the repeater has high power and high gain antennas, it can be heard 200, maybe 250 miles away, depending on the site and surrounding terrain. The problem is that it cannot hear a 5-watt HT 250 miles away on the input channel.

-- Maybe this problem can be solved with polling receivers. There is one receiver co-located with the repeater's transmitter's on top the 5,000 foot mountain. Then, secondary "polling" receivers are located in other places where the repeater output can be heard, but the distances are too great for the main receiver to hear HTs and mobiles. The repeater controller "polls" the different receivers, and when a signal is heard, it selects the receiver with the best reception of that signal and that receiver is transmitted or repeated on the output frequency.

-- The challenge here is how to get the signals from the polling receivers to the controller and transmitter on the top of the 5,000 foot mountain. Amateur radio repeater systems do this via 1.2 GHz links on mountaintops using high gain directional Yagi antennas. But GMRS does not seem to have an analogous control frequency to 1.2GHz. Could you use one of the non-repeater GMRS frequencies (sometimes known as channels 1 to 7 on bubble packs)? It would seem not. UNLESS you got special permission from the FCC to do that.

-- You might also get permission to use leased landlines which are not part of the PSTN (but are expensive) or maybe you could use VoIP

and control stations (relay stations) that are located separately from the repeaters. But Part 95 is not clear on this, is it?

This is just a stream of consciousness. If anyone else can provide the architecture on how GMRS repeaters can be linked without violating Part 95, please post your ideas here.

-- Kurt

10554. Linking GMRS Repeaters Legally / Part 3

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-14 23:30:07 UTC
From: Lake Hodges Radio
Topic: 10554 Message: 10554

Some of the challenges with linking repeaters on GMRS may be the following...

1) Everyone who uses a linked GMRS system would need to pay $80 for a GMRS license (unless they have an immediate family member with a license they can use).

2) There is no way to assure that the users are GMRS licensees. While that is true with any radio on any GMRS frequency, the problem is magnified if a jammer or a profanity-espouser starts abusing a linked repeater system that can be heard hundreds or thousands of miles away. People can buy repeater-capable GMRS radios (Motorola T7200 for example) on eBay for as little as $50. It doesn't take much for an evil-doer to create havoc. Thus, the FCC might be understandably reluctant to encourage wide area linked GMRS systems.

3) Depending on what you want to do -- if you want to do commercial business this would not work --- a FAR better way to achieve this is to do this on Ham frequencies -- 440MHz for example. Getting a technician license is easy for anyone. The licensee fee is $5. One of my 10-year old neighbors just got his tech license. Ham repeaters and Ham frequencies are self-policed by 700,000 U.S. Hams and the FCC spends very little time chasing down Ham violators. GMRS does not have a corresponding self-policing corps, and the FCC would likely have a greater workload. Since they are already in over their heads, they would probably shy away from this.

4) Ham repeaters and linked systems are generally supported by a whole team of people, not just one person. There are fewer people on GMRS with the skills and motivation to achieve this.

5) Perhaps the reasons that GMRS linked systems have not been implemented are the reasons 1-4 described above. Anyone who wants to do this would have a far easier time -- in terms of expense, available frequencies, FCC rules and assistance from other skilled people -- if they got a lot of people to help them do this on Ham frequencies.

Just some random thoughts. Opposing points of view are always respected.

Kurt,

The problem is both the Internet and leased lines do go over PSTN.

Let me explain. I want to link cross town. I get a private wire from my house to the pole then a private line from the pole to lets say my business. Everything in between the poles is PSTN. The difference is they garentee you X amount of bandwidth using a certain protocol. That is an obvious over simplification.

if you want to run a dry line. That might be different. You literally own and control 1 end to the other end of a wire no matter how long that wire is. But that has other problems of right of ways and other complications.

I have looked at both options for several projects, Between amateur radio and Computer Networks.

As for using the Internet. The Internet travels over PSTNs way back when there use to be a different now days data and voice travel next to each other. T1 or T3, DSL, ATM, OCs the list goes on is used for both Data and Voice. If the FCC or someone want's to get anal you can get nailed on this.

I see the rule more in amateur radio then GMRS (but then again I am new to GMRS). There are rules in place to prevent competition with the TelCo's I know I don't see Ham Radio as competition but rules are in place to let us know where we stand. Just a food for thought.

Hmm, I see your point and agree that this argument could be made. If
Ryan was saying the same thing you are, I must apologize to him. This
is one of the many FCC ambiguities you guys have referred to; I guess
if someone constructed such a system they might find out in court if
the FCC considers a control link to be used only for modifying the
TX/RX characteristics of the repeater (freq, PL code, power, etc.) or
if it may convey actual messages.

I don't think so. On a single-repeater system, don't mobiles listen
to the frequency they RECEIVE on before transmitting (if they don't
hear anything, then the repeater is not receiving anything to
re-transmit)? The linked system would be no different. If the

repeater at point A is transmitting over a "control link" to the repeater at point B, I at point B will hear what my local repeater is re-transmitting from the control link. If I hear nothing, the repeater at A must not be receiving anything either.

It seems that you could; certainly if you had exclusive rights to some means of connecting the repeaters. Another of those ambiguities-- who's to say that the transmit and receive antennas of a given "repeater system" must be co-located?

I have no expertise here, and was simply commenting on what seemed to be an easy interpretation of the regs. Maybe someone else with experience can explain.

I am guessing that any language is legal on GMRS as long as station
IDs are done in English or CW in the proper way. In San Diego, LA and
NYC it is HARD to find people speaking in English on GMRS. Most adult
conversations (on bubble packs -- bleebloop) seem to be in other languages.

Doesn't GMRS mean "Gardeners' and Maintenance Radio Service?"

Buenas Dias, Amigo!

See below...

95.119 Station identification.
(a) Except as provided in paragraph (e), every GMRS station must
transmit a station identification:
(1) Following the transmission of communications or a series of
communications; and
(2) Every 15 minutes during a long transmission.
(b) The station identification is the call sign assigned to the GMRS
station or system.
(c) A unit number may be included after the call sign in the identification.
(d) The station identification must be transmitted in:
(1) Voice in the English language; or
(2) International Morse code telegraphy.

I must echo "why link?"

you can use 72 meg freq to use as a control link/ remote base. But you need to get licensed for the whole thing. This was very common in the 80 & 90's.

but back to the point.. WHY???????

I think if you need more coverage that what one repeater will provide, you need a different radio service. there are 450 trunking systems, VHF Hi and low band systems you could license and use. And if you are just wanting to play and build a system, Ham radio would be the place for that.

Public Switched Telephone Network. All 4 terms have to be in play to be PSTN.

The local telephone companies offer many services that aren't switched, and therefore NOT PSTN. Internet is switched, but it isn't a telephone network. Yes, Telephony can ride on the internet, but it's not a telephone network.

You can order point to point audio pairs. Here they're called RTNC circuits. Analog pair that take audio from point A to point B. No switching, not PTSN.

You can get a free ride on someone else's T1 network. A channel bank breaks down the 1.544 Megabit signal to 24 individual point to point or point to many point voice paths. The T1 can ride microwave or Telco T1 circuits. Not switched, not PSTN.

You can get hot ring down circuits. Pick up the phone at end A and the phone at B rings. No dialing, no switching, not PSTN.

You can get DSL. Point to many many points. Switched. Not a telephone network, it's a data network. Not PSTN.

You could ride a private PBX. A point to point call, totally within the private phone system could carry audio. Not public, not PTSN.

You can set up a regular phone line to call another regular phone line. If both are flat rate and in the same calling area, no per minute charges. This could pass audio from point A to point B like an RTNC circuit, but it is on a Public Switched Telephone Network, so no, I don't think this is a legal option.

I think you're thinking that if a phone company offers a service, it's PSTN. But PSTN is only a part of the phone company's business. Sharing a pipe, a cable or a Central Office doesn't make it switched.

I think we're reading a lot into a simple rule set up to prohibit Autopatches.

As for `why'. `Why not' comes to mind. But ever since people decided to carry radios rather than using the ones installed in their cars, there's been an imbalance. 4 watts doesn't go as far as the repeater's 50. This is when repeater voting sites were invented. Many receivers, one transmitter. To get a good signal into the system they can hear well, additional receivers were needed. Linking gets that audio into the voting selector. Now, thanks to GPS technology, multiple transmitters on the same channel help fill gaps

in coverage. If you don't happen to have a mountain handy, repeater linking let's you cover an area bigger than the radio horizon allows for. We can't afford the rent on 1000' towers here, so we try to go with multiple 200' to 300' tower sites to cover one county. If I'm in the North end and someone I need to talk to is in the South end, how do I talk to them without linking if there's no repeater we can both get into? We're both on local repeaters we can access well, and still hear each other. The only way to do this is repeater linking.

Now, if your GMRS repeater is SO busy during the day that you don't have the capacity to handle additional conversations, then maybe linking isn't for you. But how often does this happen?

From: Bill
Topic: 10551 Message: 10562

Huh? What da sam hell is going on here?! Linking GMRS repeaters? Why, and I don't think it's legal. The rules state that repeaters are to receive a signal in the 467 mhz band, that's that little 5 mhz offset that you program into your HT's. Your HT memory says 462.550 but when you press that little button PTT the output switches to 467.550. The repeater must receive on the 467 freq and retransmit on 462 mhz.

As for we hams linking repeaters, that's permitted and encouraged. And the 1.2 ghz linking goin' on, well (other hams correct me if I'm wrong)we hams have a segment in the 1.2 ghz band and I believe they are linked using those allowed freqs. GMRS'ers, forget about it. There's no GMRS permitted there.

The intent, way back in the day, was that GMRS would be a business band to make it easier for mobiles used in the transaction of commerce to chat with the dizzy blonde in the office. Excuse me if any of the male population here is blonde. I meant to say the secretary. Back then there were no cell or mobile phones. Now that technogoly has made it easier to communicate and even on higher frequencies, the GMRS band is becoming less active, the FCC is generating less revenue for the "general fund" so to create more cabbage for Uncle Sam they decide to make it more attractive to the general population to use this band. And we go out and buy up those bubble pack transceivers, helping the economic community (a little).

For us GMRS'ers that want to chat farther, listen to what Kurt said in his response. Study, if you can, for a Tech (no code) license shell out the measly 5 bucks and get a 10 year ticket that's renewable for free! Then you can legally talk farther even through a repeater that uses Echolink, legally. AND, the HT's are cheaper!

Enjoy whatever band you use.....QRT!

Wayne,

It says that you may, but does not say that you may not TX on 467 with a repeater.

And Ray and the others are correct that the Part 95 rules are vague and not fully understandable.

Overall, if you could link a repeater without using telephone networkings of any kinds, then it is possible.

10565. Garmin Rhino and ERP?

Yahoo group: GMRS (2005 — 2007)

From: David Campen
Topic: 10565 Message: 10565

I see that Garmin is advertising this Rhino model as having "5 watts of transmit power". Does anyone know if this is really the ERP? I saw in a post from a couple of months ago that another manufacturer's "5-watt" radio was only 1.5-watts ERP.

Also, in that earlier post the poster gave links to where you could look up radio qualification specs submitted to the FCC. I tried this but even after I found the specs for a particular radio it was a bunch of documents and I never did find which one contained the ERP info. Can anyone give me some help on finding the document that contains the ERP data?

I wonder about the ERP of my Cobra bubblepack radios. Cobra claims "3-watts transmit power" for them.

Also, I see that Garmin says that the GMRS radios are now legal in Canada; is this new?

>

.....snip.....

You will have a major desense problem with only 150 khz of
seperation between your "normal" repeater receive frequency of
467.550 and its "second" transmit frequency of 467.700 using
standard duplexers...you would have to go with a combiner. The
minimum cost in Tessco of one with a minimum seperation of 150 khz
starts at around $3200 wholesale!!!

I'm not even sure that this would work since combiners are designed
to attach multiple transmitters to a single transmit antenna and
then using multi-couplers for multiple receivers on another single
antenna...I'm not an RF engineer, but I suppose it would work.

Look at it this way, most UHF duplexers are designed for a minimum
channel seperation of 3 MHZ at best!!!MHZ mind ya.

ERP or TPO. There's a difference. ERP is after the antenna. TPO is before the antenna. So their advertisements could be correct, but the antennas that they use may have an affect on their signal to cause it to downgrade it to the 1.5 watts, which will make it 1.5w ERP and 5w TPO.

And it's not to only cheat the customers from the power, but to save expenses on parts and labor in the building process as well.

So you're correct on both, but you need to know what ERP is and how it is used. Just a little mixup...

ERP: E? Radiating Power (after antenna)
TPO: Transmitter Power Output (before antenna) (before any accessories for that matter)

My mention of 1.5-watts ERP was for another manufacturer's radio not
the Garmin Rhino.

As for the Garmin Rhino, I guess that what you are saying is that
when they advertise "5 watts of transmit power" this is probably also
not ERP but at some stage before that. I would not be surprised that
the marketing people routinely do this.

Does anyone know how to find the ERP in the qualification documents
posted by the FCC?

10572. Midland GXT500 reply from Tech Support re: 5 watt rating

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-17 16:10:50 UTC
From: Kevin Saisi
Topic: 10572 Message: 10572

The power output given (3, 4, or 5 watts) is at the transmitter. The ERP given (from the FCC) is radiated from the antenna. The radio is a 5 watt radio.

To: Midland Tech Support
Subject: Escalate to Manager - RE: GXT500

I wrote the below email asking which power rating was correct, and your representative replied with technical and regulatory information which did not answer my question. So, I will ask my question again. The package in which my radios came in stated that the radios had "5 watts of xtra talk power". When I looked up the radios on the FCC web site is shows 1.515 watts. I thought I was buying a 5 watt radio. Do I have a 5 watt radio, or do I have a 1.515 watt radio? Is the output power 1.515 watts with an effective radiating power of 5 watts? Can you send me certification that this radio is operating with an effective radiating power of 5 watts? If not, I will need the contact information for your supervisor.
Thank You,
Kevin

To: rvcs@...
Subject: RE: GXT500
The power rating of GMRS and FRS radios are sometimes different. FRS radios are limited to a maximum power of 500 mW ERP. This limit also applies to all 22-channel FRS/GMRS units when they operate on channels 8 to 14. GMRS transmitters are tested for power output at the point that the antenna is connected to the transmitter.

The ERP of the GMRS transmitter depends on the efficiency that the antenna radiates the transmitted energy. Small consumer handheld radios have short antennas that typically have lower efficiency than those of commercial two-way radios. This difference is why the ERP measured for the purpose of regulations is less than the power output measured by connecting directly to the unit.

The regulations for FRS service dictates that the antenna must be an integral part of the radio. All units, which offer use of FRS channels, must comply. GMRS units, which only use GMRS and shared GMRS/FRS channels, may have antennas that can be detached.

Your web site and the product package indicate that the GXT500 has a maximum power of 5 watts, but the FCC web site lists it as 1.515 watts. Which is correct?
Have a GREAT Day!

Thanks, I used the second link to look up the ERP for my Cobra 4000 WX radios. The Cobra website says these radios have "RF Output 3 Watts". The FCC info says that these radios have an ERP of 2.1 watts. That seems not bad - that 70% of the RF stage output is radiated by the antenna.

It was a Midland radio that someone was talking about a couple of months ago as being "5 watts" yet the FCC showed the ERP to be only 1.5 watts. That seemed a very large mismatch between advertised and actual values.

10574. Rhino 500 series, 4.8 watt ERP, repeater capable.

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-17 21:30:43 UTC
From: David Campen
Topic: 10574 Message: 10574

Using the FCC lookup I see that the Garmin Rhino 520 has an ERP of 4.8 watts. Using the FCC search for equipment class FRF and power output of 4 to 10 watts the only other radio besides the Rhino 500 series is something made by a Japanese company - Vertex Standard - at 5.0 watts.

Is 5 watts the maximum allowed for a handheld GMRS transmitter?

It also seems that the Rhino 500 series may be repeater capable. Garmin says of these radios:
"Channels: 7 FRS, 15 GMRS, and 8 GMRS repeater "
http://www.garmin.com/products/rino520/

10575. Does anyone have a Cobra PR4700WX?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-17 23:28:25 UTC
From: David Campen
Topic: 10575 Message: 10575

One of these shown on the bottom of this page:
http://www.cobra.com/index.php?
page=shop/browse&category_id=6f41badb7bd6d07d59d680631f6546a4&id=1

If so, can you tell me the FCC ID? The FCC ID will be on a label, probably inside the battery compartment. The FCC ID will start with the letters BBO. I would expect the complete ID to be something like BBO4700WX but I can't find this in the FCC database.

I am curious as to the ERP for this model. It is advertised as having a 12 mile range. My Model 4000 Cobra is advertised as having a 7 mile range and the FCC database shows that it has an ERP of 2.1 watts. Since range varies as the square root of the power I would expect a 12 mile range to require over 6 watts ERP.

No need to lecture me about how manufacturers range claims are mostly bogus - I understand this. That is why I want to know the ERP.

Also, I understand that ERP is only one of the factors that affects range and that the inverse square relationship of range to power is theoretical and varies in practice.

10576. has any one purchased? A UHF Keypad Programmable Portable Radio w/ GMRS -DIGITAL from e-bay?

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-18 14:47:57 UTC
From: Robert Roscher
Topic: 10576 Message: 10576

Hello.....

Has anyone purchased one of these units off of e-bay? UHF Keypad Programmable Portable Radio w/ GMRS -DIGITAL 400 - 480MHz. Programmable - 4 Watt - Rapid Chgr - NEW!

I have attempted to contact the seller of the units asking for an fcc id number and i have gotten no responce, I have contacted the manufacturer in china all they say is "you can used it in your country " and does not provide an fcc id number.

here is some details from the e-bay webpage

These radios are the newest models of radios on the market.

Upgraded features include Litium Ion battery, higher 4 Watt RF Power output, and drop in base Rapid charger.

Radios are easily programmed anytime via typing desired frequency in keypad.

NO computer or programming cables are needed!!!!

We sell additional batteries, antennas and earpiece microphones for these radios. Please see below for more info.
Included Accessories:
a.. 1300 mAh Lithium Ion Battery
b.. Belt Clip
c.. Rapid Battery Charger
d.. AC Wall Adapter
e.. Antenna
f.. User Manual
g.. Direct entry of frequencies via KEYPAD
h.. 99 Programmable Channels
i.. 4 Watt RF Output
j.. Repeater offset programmable

You should consider if the radios are FCC type accepted! Many have no FCC ID number so if you are questioned about using the radio in the Unites States you will have a problem! In fact the radios are being sold (both VHF and UHF) as MURS(vhf) and GRMS(UHF) and are you are being told the seller ships from New York or California depending on which scammer is doing the selling. Also note that the prices do tend be consistent even when starting at a dollar! Wonder how they do that?! I will say that I have bought one and in fact just sent a letter to the FCC regarding the purchase as I have been stewing over the purchase for a couple of months or more as I could not get a FCC ID number or a response from the sellers. In fact they now say the radios are shipped from California but when I bought them they were supposed to be shipped from New York! And by the looks of the info you have provided you know the seller! ASK for the FCC ID Number as well as the Make and Model of the radio they are selling!!! If they give you a number look it up on the web to see if the number matches the radio they are selling as some of the radios are knock offs of US certified radios.
Many people are buying these radios and some will get cited for using them. I for one do use certified radios but even I have succumbed to too good of a deal!! I will let you know the outcome of my complaint with the FCC, Ebay, And Squaredeal as it unfolds! I hope this helps you !
Good Luck! Steve N4YZA -- WDQW656 Barefoot Bay, Fl.

Subject: [GMRS] has any one purchased? A UHF Keypad Programmable Portable Radio w/ GMRS -DIGITAL from e-bay?

Hello.....

Has anyone purchased one of these units off of e-bay? UHF Keypad Programmable Portable Radio w/ GMRS -DIGITAL 400 - 480MHz. Programmable - 4 Watt - Rapid Chgr - NEW!

I have attempted to contact the seller of the units asking for an fcc id number and i have gotten no responce, I have contacted the manufacturer in china all they say is "you can used it in your country " and does not provide an fcc id number.

here is some details from the e-bay webpage

These radios are the newest models of radios on the market.

Upgraded features include Litium Ion battery, higher 4 Watt RF Power output, and drop in base Rapid charger.

Radios are easily programmed anytime via typing desired frequency in keypad.

NO computer or programming cables are needed!!!!

We sell additional batteries, antennas and earpiece microphones for these radios. Please see below for more info.
Included Accessories:
a.. 1300 mAh Lithium Ion Battery
b.. Belt Clip
c.. Rapid Battery Charger
d.. AC Wall Adapter
e.. Antenna
f.. User Manual
g.. Direct entry of frequencies via KEYPAD
h.. 99 Programmable Channels
i.. 4 Watt RF Output
j.. Repeater offset programmable
k.. Backlit LCD and Keypad
l.. Automatic Channel Scan Mode
m.. Automatic power save mode
n.. Programmable 10, 12.5 25.0 KHz. Deviation
o.. 2 prong external microphone jack
p.. Squelch Monitor Button
q.. Rugged Aluminum Frame
Specifications:

I know next to nothing about antennas but it does seem strange to me that even allowing for the radio being a small, handheld consumer radio with fixed antenna that Midland is unable to provide an antenna that radiates more than a meager 30% of the transmitter stage output.

After all, my Cobra 4000 which is advertised a a 3 watt device has an ERP of 2.1 watts (70%). The new Garmin Rhinos radiate almost a full 5 watts. Both of those models also have "small" antennas. The wavelenght of GMRS is only about 70 cm, I don't see what the problem is making a small but efficient antenna.

I do cut the companies some slack for their outrageous marketing hype. Most people buying these radios will believe the hype and so any company not making outrageous claims will go out of business.

Even Cobra, whose claims about the model 4000 were relatively accurate seems to have been taken over by the marketing people. I see that on their website that the newer models don't even list a number for watts; now they prefer to list only range, which for the 4700 models is an astounding 12 miles.

I don't quite agree with the specifications for letters "a" and "f". And the features (accessories) for letter "n".

FRS has a frequency seperation of 12.5 Khz, wheras GMRS has a seperation of 25Khz. Which is okay, but to allow that third deviation there, voids Part 95 and it's subparts respectively.

I'd really do some research on the radio, and then use your own judgement. We can only suggest and say what you should or should not do, but the final decision is yours.

10580. Midland radios - really strange marketing claims!

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-19 18:09:07 UTC
From: David Campen
Topic: 10580 Message: 10580

Looking at the Midland web site:
http://www.midlandradio.com/comersus/store/comersus_listCategoriesAndP
roducts.asp?idCategory=39

There seems to be a really strange inverse relationship between the
marketing claims for power and range and the actual ERP shown on the
FCC website.

Midland G300 (now discontinued) FCC ident MMAG300
Claims 3 watts and 10 mile range
ERP is 2.75 watts

Midland GXT400 FCC Ident MMAGXT400
Claims 4 watts and 12 mile range
ERP is 2.0 watt

Midland GXT500 FCC Ident MMAGXT500
Claims 5 watts and 14 mile range
ERP is 1.5 watt

Can anyone propose an explanation for this other than that the
Midland marketing people are following the principal of always saying
the opposite of what you mean?

It will be interesting to see if Cobra is doing the same thing with
their latest radios.

Ah yes, the KYD TK338CT portable UHF radio. I recently got one, and planning to get my money back. Luckily I didn't pay a whole lot. The PL/ DPL are not all the same as the US PL/DPL. There really isn't any DPL for the radio. They have listed 50 freqs. for PL, NO FCC ID!! Every label on the radio is in Chinese. I tried programming my work portable freq. and PL and the radio didn't do what it was supposed to do, and that was to broadcast. I used my BC246T scanner 'Close Call Option,to see if the radio was broadcasting the programmed freq and my scanner never picked up the TX or the PL with the offset freq.. I even tried a FRS freq and my scanner never picked up any PL but picked up the freq..These radio make great fancy FRS radios but, without a FCC ID NOT Leaal.

Listed PL/DPL freqs (labeled as QT/DQT)

1. 67.0 11. 94.8 21. 131.8 31. 171.3 41.
203.5
2.69.3 12. 97.4 22. 136.5 32. 173.8 42.
206.5
3 71.9. 13. 100.0 23. 141.3 33. 177.3 43.
210.7
4.74.4 14. 103.5 24. 146.2 34. 179.9 44.
218.1
5.77.0 15. 107.2 25. 151.4 35. 183.5 45.
225.7
6.79.7 16. 110.9 26. 156.7 36. 186.2 46.
229.1
7.82.5 17. 114.8 27. 159.8 37. 189.9 47.
233.6
8.85.4 18. 118.8 28. 162.2 38. 192.8 48.
241.8
9.88.5 19. 123.0 29. 165.5 39. 196.6 49.
250.3
10.91.5 20. 127.3 30. 167.9 40. 199.5 50. 254.1

(The above info was NOT copyrighted, I looked cover to cover)

Buyer beware, like they always say-"If it is too good to be true, then it probably isn't!!"

I have tried to get customer service from Metamerchant and got no return and gave them a poor rating on eBay. I plan on sending little note to eBay warning them about the problem and the FCC issue.

10582. Re: [GMRS] Rhino 500 series, 4.8 watt ERP, repeater capable.

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-19 09:02:42 UTC
From: kvsp1160@aol.com
Topic: 10574 Message: 10582

Sec. 95.135 Maximum authorized transmitting power.

(a) No station may transmit with more than 50 watts output power.
(c) A small control station at a point north of Line A or east of Line C must transmit with no more than 5 watts ERP.
(d) A fixed station must transmit with no more than 15 watts output power.
(e) A small base station must transmit with no more than 5 watts ERP.

So the 5 watts on this particular radio is because it also has FRS frequencies on it as well. And the FRS frequencies should be TX'ing at no more than 1 watt on channels 1-7, and .5 watts (500 mW) on channels 8-14.

I'm actually surprised (not really though) that Garmin added the repeater pairs (467) to the GMRS/FRS set as well. But as with all of their equipment as seen in the past, unless it is written in the FCC database, it is not Part 95 accepted. This is because of the added features that Garmin's GPS system can offer, plus add-ons for future uses.

But enough of that. Be thankful it's at 5 watts and not the full 50 watts. Please... Be very thankful!

I also could suggest if you don't want to spend a lot of money for a UHF portable you look at the following auction on Ebay. This seller has been selling at BARGAIN prices 16 channel Midland portables and he will program them for your frequencies. These radios,some don't know, are really Uniden spu51's with the Midland name on them! I have about 10 here also but can not match his price!! He sells them as a pair and they go from 25.00 to 65.00 for the pair! These portable radios are certified part 95 and 99 and even though he shows them as 450 to 470 mhz they will program from 438 to 512 mhz with ctcss or not, wide narrow, high-low power and etc. Well just a thought!

Since the FCC mandated about 20 years ago that "user programmable" was a no-no, I doubt seriously if there will be a FCC type acceptance issued.

I remember quite clearly when it happened - fortunately, I had already on order an ICOM programming box for the IC-V100/400 series...

These are Chinese export radios and not type accepted for use in the
US. Plus, they're cheap, and you get what you pay for. Not suggested.

Topic: 10572 Message: 10588

The poorly designed antennas do loose some power but not as much as what fcc has them rated. Their is something else going on.

10589. Midland radios - really strange marketing claims!

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-19 19:43:14 UTC
From: Lake Hodges Radio
Topic: 10580 Message: 10589

David... you should include the selling price for each radio in your table and this formula may help you....

The formula is ME=p*x

ME= marketing energy

p=price

x = lie constant (aka exaggeration coefficient)

Marketing energy is a function of the selling price.

The higher the selling price, the more they lie to try and justify the higher price.

The manufacturing cost of the GTX500 compared to the GXT400 is probably only a few cents. But the price is many dollars higher, and so it must be marketed more vigorously with greater exaggeration.

I have not purchased this particular model but have bought both VHF
and UHF China and Taiwan models. You will not get any information as
to FCC acceptance because they are not FCC type accepted. However,
there are several models by different Asian manufacturers that are
building both Icom and Kenwood HT's! Yep. Both the VHF and UHF ones
I have are quality radios (not cheap) and probably meet US specs but
they just have not gone thru the process. The VHF radio I have is
smaller than a typical GMRS/FRS bubble pack but nearly twice in
weight and looks like a certain Kenwood HT I've seen but can't
remember which one. I am an experimenter and love testing these
things out but use your own judgement in purchasing one.

Hi Robert

I don't think these radios are even legal to use as a receive only radio...even in amateur service since there is no FCC ID....no part 15 certification and for sure not legal for GMRS or even part 90. The only entities that are possibly legal would be government users and I doubt if they would even be legal.

If you have any FCC licenses, I'd recommend you stay clear of these radios like the plague!!!

Hi David

No, there isn't a rule stating that 5 watts is the max, its just
that having a radio with more than 5 watts or so right beside your
head and eyes at UHF frequencies isn't a good idea.

Bob, GMRS WPVV845, Amateur KG4WAD, LMRS WPXC892

10594. Cobra marketing claims much like Midland

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-20 01:46:33 UTC
From: David Campen
Topic: 10594 Message: 10594

It seems that Cobra has decided to match Midlands bogus marketing claims. The Cobra PR4700 radio is marketed as having "up to 12 mile range". The FCC (FCC Ident BBO4700PR) shows that this radio has an ERP of only 1.2 watts. My older Cobra PR4000 (FCC Ident BBOPR4000WX)which was advertised as having a range of "up to 7 miles" has an ERP of 2.1 watts.

So, like Midland, Cobra's new radios have reduced ERP but even more wildly exaggerated range claims.

I understand to motivation to exaggerate the range claims but why are they reducing the ERP. Do they somehow save a few bucks in manufacturing a radio with reduced ERP?

All this while the much maligned Garmin is actually building a radio with almost 5 watts ERP.

I purchased two radios from "poweredealer" on ebay. They were both KYD brand. The UHF radio didn't hold a charge for long and the VHF radio stopped working the first time I dropped it. I didn't bother asking for my money back as "poweredealer" was so rude to me when I asked a post-sale question. We ended up in a battle and had our feedback mutually withdrawn. My advice is to stay with the known brands and buy from a reputable dealer if you can afford it. As for GMRS Radios, I am waiting for someone to come out with an inexpensive 5 watt with repeater capability. But I know that I will be waiting a VERY long time.
Have a GREAT day!

10597. Kenwood TK-3101 - truth in advertising. Also Emergency Channel

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-20 23:47:58 UTC
From: David Campen
Topic: 10597 Message: 10597

Looking the the advert for this:
http://www.kenwoodmpd.com/Kenwood%20TK3101%20Brochure%20ECS.pdf
It is advertised as 2-watts. They even give the FCC ID (ALH27303110)
and the FCC website shows that the ERP is 2-watts. Seems the marketing
folks haven't taken over here yet.

The advert also mentions:
"The GMRS emergency channel (channel 10) should only be used for
soliciting/rendering traveler aid or for emergency communications for
immediate protection of life or property. In some areas, volunteer and
public safety organizations may monitor this channel."

I assume that GMRS Channel 10 is equivalent to Channel 17 on 22 channel
GMRS/FRS radios?

Is this Channel really actually being used this way?

Is this radio worth $200 when I can buy a Cobra 4000 for $100 per pair?

Even though most receivers sold in the US have an FCC sticker on
them, doesn't necessarily mean one that doesn't have the sticker, is
illegal for receive only. Most of the hams that are capable of
building their own equipment (both receivers and transmitters) don't
have them FCC reviewed and a sticker on them. But that also doesn't
mean that ham built equipment is inferior either.

Well..... Actually there is a rule.

§ 95.29 Channels available.
>SNIP>
(f) Except for a GMRS system licensed
to a non-individual, a mobile
station or a small base station operating
in the simplex mode may transmit
on the following 462 MHz interstitial
channels:
462.5625, 462.5875, 462.6125, 462,6375, 462.6625,
462.6875 and 462.7125.
These channels may be used only under
the following conditions:
(1) Only voice type emissions may be
transmitted;
(2) The station does not transmit
one-way pages; and
(3) The station transmits with no <<<<====
more than 5 watts ERP.

From: David Wild
Topic: 10600 Message: 10600

Hi,

I have a Kenwood Tk-880 and have been using it with a KMC-27A microphone (the standard, big grey one). I just bought a KMC-30, and was surprised to see that it has a wider connector plug, but it still fits in. However, when I try to transmit with it, the light turns red but no audio is transmitted. Weirder, when the microphone goes on or off hook it seems to engage PTT. Any ideas? Do I need the radio programming specifically for this microphone? Thanks! David, WQDA362

The 'rule of thumb' used by radio system designers is that
rubber-ducky style antennas have a LOSS of 9dB compared to
a 1/4 wave ground plane.
That means that the ERP is 1/8th of the power out.

I would like to know where you find them this cheap. For the last
month and a half they have been going for $75+ each or $150+ per pair
on eBay, and the new units usually don't even have NiMH batteries!
Please let me know as I'm looking for a couple to go with the one I
just bought (for $75).

Wayne

The Moto 7200s seem nice. The FCC report says they are 1.6 watts ERP. I didn't know that it was repeater capable.

Still, where I use my radios (wilderness areas) there are no repeaters and unlikely to ever be any repeaters so I will stick with my Cobra 4000s at 2.1 watt ERP and keep hoping for an inexpensive 5 watt ERP radio.

I realize though that it seems unlikely that there will be any inexpensive 5 watt radios as the marketing people seem to have discovered that their range claims don't have to have any basis in reality and that they can sell new radios by using outrageous lies.

Motorola went the same direction when they sold their FRS/GMRS development to Giant Electronics out of Hong Kong. For example, the old T7200, with a claimed range of 5 miles, puts 2 watts into the antenna and gets 1.55 watts ERP out. I think this was one of the last radios designed by Motorola at their Plantation, FL facility. Now the much-newer T7400, claimed to go 12 miles, also puts 2 watts into the antenna but only gets 0.98 watts ERP out. So 2/3 the power gives two and a half times the range. Hah hah. At least Motorola advertises the power into the antenna rather than just giving the public a totally bogus range estimate.

I believe the cheap contract design houses that have enabled the bubble-pack price plunges do not have the RF expertise to build a quality antenna, nor do they put resources into researching what would make a good one.

Maybe I can shed a little light on what ERP means for any non-technical folks who are curious. It is a way of relating the performance of the transmitter to a common reference, which is a dipole antenna fed by a signal generator. What the test house does is transmit from the radio under test to a receiving antenna, and adjust the orientation of the radio for a maximum received signal (because most antennas are directional). This received signal strength is recorded. Then the radio is removed from the test stand and replaced by a dipole and it (the dipole) is driven by the generator and the power is adjusted to give the same signal strength at the receiving antenna. The power fed into the dipole is what is reported to the FCC. So, in summary, if your radio transmits 1.55 watts ERP, it means that in the direction the signal is strongest, it is as if you had removed the original antenna and replaced it with a dipole and your transmitter drove 1.55 watts into the dipole.

p.s. I don't see how Garmin gets such good antenna efficiency and would like to see some field reports on the 5 watt Rhinos. Do they really have much better line-of-sight range than other FRS/GMRS radios?

Wayne

Hmm, perhaps that rule of thumb was formulated for VHF radios.

If it was true for my Cobra 4000 with a 2.1 watt ERP then this radio would need 17 watts out of the RF amp and even more overall load on the batteries. But this device runs on 4 AA cells which would be very hard pressed to deliver 17+ watts.

By the same rule of thumb the handheld Garmin with 4.8 watt ERP would need almost 40 watts out of the RF stage.

At UHF frequencies the antenna on a handheld could easily approach 1/4 wave.

If you bid on the 7200R model, they come with rechargeable batteries. I guess I will put a couple of pair for sale on ebay if they are bringing that much now.

I would like to know where you find them this cheap. For the last month and a half they have been going for $75+ each or $150+ per pair on eBay, and the new units usually don't even have NiMH batteries! Please let me know as I'm looking for a couple to go with the one I just bought (for $75).

Hi Bill

Yea, I agree with what you are saying regarding home brewed amateur equipment, however, even that has its limitations. If memory serves, only 1 transmitter (amplifier) can be built per year without FCC approval. I'm not sure of tranceivers...again I'm thinking only 1. My point was that this is new equipment and thus should have the certification affixed to the unit. I belive that even the action of physically pulling off the FCC label invalidates the certification of that particular unit, correct me if I'm wrong on this.

Thing is, receivers have oscilators (sp) in them and are un-intentional radiators, like electric fences can be, and can cause inteferrence. Part 15 deals with these issues.

The T7200 is the last that I can find in the FCC files using the
Grantee code of AZ4, that was in May 2002. So I guess that it was
after that that they sold out to Giant Electronics who must have a
different Grantee code.

> I believe the cheap contract design houses that have enabled the

So it seems that Cobra, Midland and Motorola have all gone down the
path of producing the cheapest possible radios and depending solely
on outrageous marketing fantasies to sell the stuff.

I should buy another pair of Cobra 4000s or a pair of Motorola T7200s
while there is any stock left of the quality radios.

Is the T7200 really repeater capable?

Well the Cobra 4000 and Motorola T7200s seem to be getting about 70-
75% efficiency from their antennas. If Garmin can do the same then it
would only need about 7 watts out of the RF stage. This would be

doable with Lithium ion battery pack or even the 6 AA cell alternative battery pack.

What I would really like is a 5-watt GMRS only radio with detachable antenna. But the only radios like that seem to be commercial radios that sell for several hundred dollars each.

So is the ERP the only parameter from the FCC reports one needs to consider?

Best wishes,
Alex.

Bob, this only applies to amateur rf amplifiers capable of transmitting at 30 Meg and below. Amateur equipment does not require FCC approval, or we would never be able to build our own transmitting gear.

Hi, and just thought I would add some more to the subject. I have had about 5 conversations in the last 3 days with the F.C.C. in D.C. and they are were already looking into the sales on EBAY before I complained. They have stated that they do not have jurisdiction if the seller is outside the United States but if the Seller is in the United States then they would be very interested in any information regarding the items. While ham radio operators do build (as I have) transmitters and receivers as well as convert radios from surplus and other sources they are completely responsible for the problems that may be caused by them. What hams don't do because they can't is build NEW transmitters and receivers for sale to the general public. They do not build equipment which is operating on the Business Band . I guess I do not understand why people have so many problems finding portables with 4 or 5 watts as there are many used commercial radios available at very reasonable prices. If it is programmable from the front it is probably illegal as that has always been a no no! That is why I should of known my self when I bought one of these portables for 40.00 that it was too good a deal! Anyone that has bought one of these radios and wants to try to get their money back may want to file a complaint with EBAY as well as the F.C.C.. EBAY is already looking into the matter as well.
Will follow up if I hear anything more about this subject either from EBAY or the F.C.C.

Yes, that is my point-- Garmin claims their radio puts 4.95 watts into the antenna and gets 4.57 watts out, for an efficiency of 92%.

Do you know how much power is possible at UHF frequencies using today's technology and, say, a 7.5 volt battery (which is Garmin's stated voltage to generate 5 watts, BTW)? I guess the PA must generate the power at a lower impedance point and then match it to the antenna through LC networks. You couldn't generate 5 watts directly into 50 ohms given a 7.5 volt supply, if I'm not mistaken.

Hmm well then I guess my 4 to 5 watt portable using a 7.5 volt battery into my Bird wattmeter with a dummy load can't be right because it shows 4 to 5 watts out depending on the frequency. I use a midland commercial portable and while the FCC states that the radio is 5 watt Midland actually maintains that it is a 4 Watt UHF portable. Of course with these radios it is simple to unscrew the antenna and screw in a wattmeter or external antenna. So my answer is yes you can generate 4 to 5 watts with 7.5 volt batteries. Thanks Steve

10620. Happy Holidays / info request

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-23 23:26:47 UTC
From: Adam Karsin
Topic: 10620 Message: 10620

Ok I have hit most of the radio groups I belong to for this one, looks like I will be spending my Holiday Weekend traveling to Arkansas for a family emergency. I'm planning to outfit myself with enough toys to make the drive entertaining. Between my VX-7, IC-207h, GMRS and CB I do not think I can go wrong!! So the question I have is. is there anyone out there that has a decent file for the path I am taking? Looks like us 19N -> I-10W -> 231N -> (this will put me into Montgomery, AL) from there I will take 80W -> I-20, once in LA, I will take 65N to Little Rock, AR. I would be looking for HAM, GMRS and anything else, I would even take Public Safety, as it can be entertaining to listen to and a good source of highway information!!

If there is anyone (local to Tampa) that has an electronic copy of the ARRL repeater database, that I might be able to borrow? I would never get one in time to leave tomorrow.

I have the Commander and ADMS for the VX-7, but no program for the 207H but would take assistance in loading it if anyone is inclined!!

Thanks,

Adam

Why not? Are you using Ohms Law? Ohms Law doesn't apply to circuits
that contain amplifiers such as transitors or vacuum tubes.

Ohms Law certainly DOES apply. But you cannot assume the voltage at the transmitter output is the same as the battery voltage.

If you had the equipment to measure the RMS voltage at the transmitter output, then you would be able, using Ohms Law, to determine the output current into 50 ohms, and from there, calculate the wattage.

True but most hams look closely at the calculated input power so they will use the following formula to come up with input so as to not exceed the FCC rules for power levels (at least for me in the old days!)
P=E X I or Power = Voltage times current so for example I am drawing 670 milliamps at 7.5 volts I would have an input power of (5.025)P=(7.5 volts) E * (.670 amperes) I or 5.025 Watts . Lets say you are limited to an input power of 5 watts and you know the voltage to the final is 7.5 Volts you can find the current that you will draw by using P/V=I or 5Watts /7.5 Volts = 0.6666666666666666666666666666667 milliamps. So no problem doing the 5 watts with a 7.5 volt battery!
Also note that these measurements are for the final output circuit only not the whole radio. Lots of radios show measurements in different ways and it is something we as consumers have to watch closely! Same thing happened when they came out with solid state audio amplifiers and they used the RMS as the shown output power! People that were used to a 50 Watt tube audio amplifier being 50 watts were surprised when the new amplifier was really a 25 watt amplifier when using the old way of ratings. Hmmm showing my age! Well just wanted to point out that it is easily possible to have a 5 watt radio with 7.5 Volts. Now how long it transmits is another story as you then have to figure out the AmpHour rating etc. of the battery!
Steve

Ohms Law certainly DOES apply. But you cannot assume the voltage at the transmitter output is the same as the battery voltage.

If you had the equipment to measure the RMS voltage at the transmitter output, then you would be able, using Ohms Law, to determine the output current into

50 ohms, and from there, calculate the wattage.

Ohms Law describes the relationship between voltage and current in a resistor.

> But you cannot assume the voltage at the transmitter output is the
> same as the battery voltage.
Exactly because between the battery and the load is a black box that cannot be analyzed using Ohms Law.

>
> If you had the equipment to measure the RMS voltage at the

But the voltage at the transmitter output was not being discussed.

What was being discussed was a battery connected to a circuit that was then connected to a load. In that analysis Ohms Law could not be used to determine the current in the load as a function of the battery voltage i.e. Ohms Law did _not_ apply.

Also, given the voltage and resistance at the load as scalar values you still would not be able to calculate the power dissipated in the load.

I'm assuming that you meant 'tones' as in PL or CTCSS? If so, try here.
http://www.rampart-sar.com/ctcss.htm
Please note that not all radios have the same line up or number of tones. Your radios may have 38 while others may have more or less.

So no problem doing the 5 watts with a 7.5 volt battery!

Okay, I see where you are coming from. When I was a kid I bought a Radio Shack hand-held CB that was advertised as 3 watts, but the owner's manual admitted the 3 watts was sourced into the PA and only 1.5 watts got delivered to the antenna. Same thing as what you're talking about. So...

I would like to make it clear that what I am referring to is power delivered into the antenna. When Motorola and Midland and Garmin and probably the other manufacturers say they have a 5 watt or whatever radio, they mean power into the antenna. You can see from the RF test reports on the FCC's web site that source power into the PA is roughly twice what is delivered to the antenna.

The question I originally asked stems from the fact that if you attached a 50 ohm resistor to a 7.5 volt battery, it would dissipate 1.125 watts. There is no way an amplifier transistor operating off a 7.5 volt supply can dump a sine wave with a peak value of more than 7.5 volts directly into a 50 ohm load; since the RMS value is seven-tenths the peak, the average power will be much less than 1.125 watts.

Now, if the amplifier transistor drives a lower-impedance load, the current is higher even though the voltage peaks are still 7.5 volts or less, so power is higher as well. Then I assume an impedance matching network is used to transform the amplifier's impedance up to 50 ohms so it will be matched to the antenna, shifting the voltage up and current down in the process. I believe this is the only way to achieve 5 watts out.

I was wondering if anyone on the list is intimately familiar with RF PA design and could verify this.

David Campen:
What, are you trying to argue about it??

You said:

> Why not? Are you using Ohms Law? Ohms Law doesn't apply to circuits
> that contain amplifiers such as transitors or vacuum tubes.

As it stands, that statement is entirely incorrect.

Wayne: Yes you are right there is pretty much always impedance matching. That is how you can have for example a 50 watt radio running on 12 volts in your car. THe voltage remains the same but the current is higher than say a 5 watt radio. There is no magic.. the laws of thermodynamics aren't violated, and neither is Ohms law violated. Ohms law is in force in all parts of the radio circuit, transistors and tubes included. Whatever portion of input power that does not leave the radio as RF will leave it as heat, light, sound, or some other form of energy.

You seem to be the one who wants to argue. As I said Ohms law only applies to resistors where it describes the voltage-current relationship in a resistor. Ohms law does not describe voltage-current in transistors, vacuum tubes, capacitors, inductors our anything else except a pure resistor.

It's legal in every aspect if each family (or person from another family) has their own GMRS license, which will allow them to use your repeater systems. They may use scanners to listen to information received on a particular frequency that is being discussed between a party or group if they choose to do so.

But if you open your repeater system to the park for free use without proper licensing, you will have more trouble and chaos on your hands than you will think you have.

FRS without repeaters on a person-to-person support group would be an ideal way to go, or having licensed GMRS volunteers help others is another thought, but not for free use.

Now advertising your system for those with licenses to contact you for system information, is one way to go. This way you can control who accesses your system and who doesn't.

Good luck with your new group, and don't give up. If you seem to come to a roadblock, try a different route. Most people give up on their first try. If you were if CA, I'd support you in any way that I can. FYI: I do have a group of my own with a system in the process of building. It's hard to compete with the big guys, but I have succeeded where others have failed and quit. I admire your aquire of land. Keep it up!

Thanks, Ben, for confirming my understanding. It has been 8 years since I was involved in development of a transceiver circuit and my memory is a little rusty, and I was a receiver/frequency control person at that. The PA designer on our team kept the details pretty much to himself; I knew his design operated Class C as most narrowband FM transmitters did at the time (do they still?) and it only put out 100 mW from a 3V battery.

I'm with you on Ohm's Law. We just have to agree that V=I*Z and all quantities must be treated as complex numbers.

Have a good day.
Wayne

If you have a 7.5 volt AC source then put it through a 1:2 transformer.
You get 15 volts on the high side terminals of the transformer and a 50
ohm resistor across those terminals would produce 4.5 watts of heat.

Exactly. The transformer is the impedance-matching network of which I spoke.

Wayne

10638. Midland LXT435-PV3 and repeaters

Yahoo group: GMRS (2005 — 2007)
Date: 2005-12-29 07:00:35 UTC
From: Steve Smythe
Topic: 10638 Message: 10638

Hello,

I'm new to the group and bought four Midland LXT435-PV3's for my family's use and purchased my GMRS FCC five-year license. A friend of mine at work was explaining how repeater technology works on some of the other bands, and I'm interested in learning about it in the GMRS band.

I looked through the operator manual for the LXT435 and see that the "privacy codes" (CTCSS) frequencies match some of the open repeater tones (like 123.0 Hz). One real drag is that these radios don't have independent transmit and receive channels.

Does anyone know of a simple mod or firmware change for this series that would handle this for repeater use?

If you have any suggestions for sites I can learn more about GMRS and repeaters, please let me know.

Thank you for your support,

Steve Smythe

I'm not familiar with those radios, but it sounds like that they can't be changed. The model number looks like a bubble pack radio, but I'm just guessing.

With everything that a GMRS repeater has to offer you, I'd suggest to get at least one or two good commercial radios that can be programmed, and have the option of being equipped with the DTMF pad (which is also very helpful when you get into building your own system later on).

I'd try to first find a repeater system to use, with permission, and then find the right radio for your use or for your family. Also ask the owner if his system allows family use or if it's based more towards personal or group discussions, etc.

Repeater or duplex communications are very different than simplex communications, so you really need to know what you want and what you're getting into before you get your hopes up. But once you achieve your goal and make a contact on a repeater with someone, you will feel very proud of yourself for coming thus far.

As with everything in life, if you want it really bad, don't give up. keep going and continue to strive for the best. You can do anything if you set your mind to it.

Get a Polly and hook it up to your FRS-only radio, and stick it in a high spot - http://aditl.com/ham/polly.html

Then it would be legal.

Nope the midland radios are not repeater capable. You will need to buy
repeater capable units to access a repeater.

From: Steve Smythe
Topic: 10638 Message: 10651

Thanks Ryan and Jesse,

These are the "bubble pack" variety and I've had great success with them so far. They work great with skiing up on Mt. Rose and around town here in Reno. I live at 5600 feet and can get about 7 miles out to mid-Reno on the GMRS bands.

I've looked around at some radios (like Yaesu and ICOM), and am a little confused as to how to tell if they are capable of the GMRS 462.5-7 MHz bands. If they specs list a range of frequency like 420 - 470 MHz ("U-HAM"), does that mean they can be tuned to those frequencies?

Also, what keywords should I be looking for when I look for repeater capable radios. Is it ARS? Standard repeater shift (seems to be +/- 600kHz)? Or something like that?

Thank you again for all your suggestions and input.

Subject: Re: Midland LXT435-PV3 and repeaters

I'm not familiar with those radios, but it sounds like that they can't be changed. The model number looks like a bubble pack radio, but I'm just guessing.

With everything that a GMRS repeater has to offer you, I'd suggest to get at least one or two good commercial radios that can be programmed, and have the option of being equipped with the DTMF pad (which is also very helpful when you get into building your own system later on).

I'd try to first find a repeater system to use, with permission, and then find the right radio for your use or for your family. Also ask the owner if his system allows family use or if it's based more towards personal or group discussions, etc.

Repeater or duplex communications are very different than simplex communications, so you really need to know what you want and what you're getting into before you get your hopes up. But once you achieve your goal and make a contact on a repeater with someone, you will feel very proud of yourself for coming thus far.

As with everything in life, if you want it really bad, don't give up. keep going and continue to strive for the best. You can do anything if you set your mind to it.

Hate to be the party pooper:

Sec. 95.194 (FRS Rule 4) FRS units.

(a) You may only use an FCC certified FRS unit. (You can identify an FCC certified FRS unit by the label placed on it by the manufacturer.)
(b) You must not make, or have made, any internal modification to an FRS unit. Any internal modification cancels the FCC certification and voids your authority to operate the unit in the FRS.
(c) You may not attach any antenna, power amplifier, or other apparatus to an FRS unit that has not been FCC certified as part of that FRS unit. There are no exceptions to this rule and attaching any such apparatus to a FRS unit cancels the FCC certification and voids everyone's authority to operate the unit in the FRS.
(d) FRS units are prohibited from transmitting data in store-and-forward packet operation mode.

So that means that unless the simplex-repeater unit is Part 95 accepted and made specifically for use with a FRS radio, it cannot be allowed.

Why not a human link of communications. Acts like a repeater, but is less cost effective and more user friendly. Plus, you'll grow closer as a group and bond with a greater friendship...

It appears the #435 is a non-current year model GMRS/FRS radio and
can not be used on repeaters. It's a "simplex" only transceiver.

Steve,

If you're looking for repeater-capable radios, try eBay. Many will be listed in the ham radio/industrial category. Do a keyword search for: uhf radio, 467, gmrs, gmrs repeater, etc.

If you're looking for a repeater to build and use within the GMRS, do a keyword serch on eBay for: uhf repeater. It'll bring up alot of gear and options. If you need a duplexer, then type in uhf duplexer.

Always remember that you're in UHF on the 462/467 frequency (550-725). The sub tones range from 67.0 hz to 250.3 hz. GMRS operates on a 25 khz frequency deviation. You contact (TX) all repeaters on 467, and receive (RX) all repeaters on 462.

Here's a very helpful site or two that will answer most of your questions:

http://www.provide.net/~prsg/

Do people not read the rules and spite me for the heck of it?

Your mic does not alter your voice, so it's fine. The simplex repeater alters the audio. It makes it stronger; amplifies; changes the wattage from .5 watts to anything higher than that... Alters the audio.

Your mic allows you to keep your radio at another location on your body (or a desk) while you talk through the hand held unit. It then takes the audio from that speak and travels down and bypasses the internal mic to the radio. It was made to do that. It's not changing your voice, or changing that wattage of the signal. Just giving you more options to communicate easier while biking, jogging, driving, security, etc.

See the difference? 73...

Hello, Ryan -- I'm in the Silicon Valley area and recently received
my GMRS license/callsign --

My partner and I have a pair of VISAR HT's , and a Motorola
super-consolette..
I still have to get the consolette re-crystalled so it will be on
the air a bit later on...

I'd be interested in being a network participant on your repeater
system if you are looking
for users in order to help defray some costs ...

Hi Bob,

Amazing how I know where that is! I live in the Almaden area off of
Almaden
and Harry near the Calero Reservoir and New Almaden.

I'll have a repeater system up by the summer if you're ever in the area.

FRS uses 12.5 KHz. GMRS uses 25 KHz.

This would make sense since channels 8-14 on the FRS use 467 as part of their frequency plan. Which would seem like they will interfere with GMRS repeaters, but not very likely, since their transmitting wattage is very low and their frequency has seven digits, instead of six like GMRS:

FRS: 467.7125
GMRS: 467.7250

Plus they are one point off GMRS, so it wouldn't really make much of a difference anyways. But some have reported hearing FRS of their repeaters. But it's very rare.

FCC Part 95.29 will show you the difference in frequency change:

http://a257.g.akamaitech.net/7/257/2422/12feb20041500/edocket.access.gpo.gov/cfr_2004/octqtr/47cfr95.29.htm

Hi Bob,

Unless you know that your radio has built-in current limiting in the battery charging path, you should be very cautious attaching it to a car battery.

The following comments assume your radio does not have current limiting. I don't know one way or the other.

If you do not implement a current limiter, your car battery will pump in LOTS of current, until the voltage at the radio is equal to that of the car. If the nominal voltage of your radio's battery pack is much less than 12 V, I would expect you to fry wires or blow up your radio before equilibrium is reached.

The very least you should do is attach an ammeter in series with your charging cable the first time, and make sure the current is not excessive.

How do you plan to make sure you do not overcharge your battery? Typical wall transformer slow chargers will overcharge a battery if left hooked up too long but the current level is low enough that battery heating is not excessive. Almost all fast chargers measure peak voltage drop and/or temperature rise to determine when the battery is full, and disconnect automatically. A very hot battery is a destroyed battery. And any NiMH battery will be damaged by overcharging, whether slow or fast.

Just some things to think about.

Wayne

Hi Mike

Actually, deviation for GMRS is +-5 kHz with a 20 or 16KOF3E
emission...the 12.5kHz and 25 kHz numbers refer to bandwidth-not
deviation...related but different animals. Kinda think of deviation
as "volume" in relation to RF signals.

PART 95--PERSONAL RADIO SERVICES--Table of Contents

Subpart E--Technical Regulations

Sec. 95.633 Emission bandwidth.

(a) The authorized bandwidth (maximum permissible bandwidth of a
transmission) for emission type H1D, J1D, R1D, H3E, J3E or R3E is 4
kHz.
The authorized bandwidth for emission type A1D or A3E is 8 kHz. The
authorized bandwidth for emission type F1D, G1D, F3E or G3E is 20 kHz.
(b) The authorized bandwidth for any emission type transmitted by
an
R/C transmitter is 8 kHz.
(c) The authorized bandwidth for emission type F3E transmitted by
a
FRS unit is 12.5 kHz.
(d) For transmitters in the LPRS:
(1) The authorized bandwidth for narrowband frequencies is 4 kHz
and
the channel bandwidth is 5 kHz
(2) The channel bandwidth for standard band frequencies is 25 kHz.
(3) The channel bandwidth for extra band frequencies is 50 kHz.
(4) AMTS stations may use the 216.750-217.000 MHz band as a single
250

ACTUALLY, the 12.5 and 25 kHz refer to the channel spacing.
GMRS radios are permitted UP TO +/- 5 kHz deviation and FRS is
permitted +/- 2.5 kHz deviation.
In the example of 16KOF3E, the '16' is the occupied bandwidth, which
is determined by taking the peak deviation (5 kHz) adding the highest
audio frequency (3 kHz) and multiplying by 2.

Don't forget that the FCC rules were written 'by lawyers, for lawyers'.

I totally agree. No other antenna holds up as well in a lightning hit. They also held up very well in Wilma here in So. Florida, CAT 3. I wish the VHF cousin, DB224, did as well in high winds.

Don't go cheap with the mount. Through-the-wall mounts only.

More data on this antenna:

http://www.repeater-builder.com/db/db-420-assembly-mounting-instructions.pdf

The bad news is that they're big and they're heavy. You'll want to look locally and take a truck.

The DB-404 is a smaller, lower gain, version:

10683. RE: [GMRS] Seeking GMRS repeater antenna

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-07 22:18:36 UTC
From: kevin asato
Topic: 10675 Message: 10683

DC grounding is where the radiating portion of the
antenna is physically tied to the ground, either
directly or through an impedance matching coil. The RF
is not bothered by this connection as the feed point
(where the coax meets the antenna) is at a resonance
point for the AC oriented signalling to be radiated.
The theory behind DC grounding is that static charges
do not have a chance to build up on the antenna as
they are bled off directly to earth, thus minimizing
chance of a lightning strike.

From: drotschmann
Topic: 10689 Message: 10689

Hi there ... I am new to GMRS and bought a couple of Midland LXT 435 radios.
They are currently on sale at BestBuy for $49.95. Seemed like a good deal to me for these.
Are these any good or are there otehr GMRS radios to recommend over these for a similar price (Motorola?)

Please advise and help this newbie out.

Thank you !!!

10690. Re: Midland LXT435-PV3 and repeaters

Hi,

I have four of these same radios and they work great! I've been able to broadcast 7 miles from my house (up on a hill) to midtown Reno. They also work great while skiing.

What are you using these for? Sounds like you got a better deal on them than I did. The only bummer about these radios is that they are not repeater capable. They operate only in simplex mode. The privacy channels are a nice feature for sure, so you don't have to listen to everyone else on the same channel.

73,

Steve WQEC435

Hi Mike,

Others have said "wide" as that is what GMRS uses. I think though that it really depends on what kind of radios you are talking to; if FRS units, use narrow (I'd guess a lot of the FRS/GMRS radios are narrow-only as well) but use wide otherwise as it gives better audio quality.

What Ryan said about repeaters got me onto a technical thought. When a repeater receives a signal at 467 MHz, it must demodulate it to decode the PL tone and know when to transmit. But does it take this baseband audio signal and modulate a 462 MHz carrier with it, or does it take the output of the limiting amplifier (an intermediate frequency that is still modulated, assuming a conventional superheterodyne architecture) and mix it up to 462 MHz? Or does it depend on the repeater? Anyone know? I don't.

Wayne

10696. Dead or Dying Battery Packs

Hi there,
Yes, Best Buy just put them on sale this weekend. If you want good
deals on Midland Radios, also check eBay. they have a ton of 4 watt
and 5 watt radois out there for resonable cost.
I am primarily using these on our boat to communicate with my wife
adn around the hosue and yard to talk with my wife. main use will be
boating to have privacy even though we have a VHF radio on board.

10698. Re: [GMRS] newbe looking for advice

From: kvsp1160@aol.com
Topic: 10694 Message: 10698

Well,

Let me think here... GMRS doesn't necessarily come in a base radio. Unless you buy a commercial radio like a GE Executive II Base radio (like I have). They're very cheap when you find them at the right time (around $25-45) plus $45 for a pair crystals.

(find them on eBay or at ge-mastrii@yahoogroups.com)

For mobile, I can recommend the Kenwood TK-840-D, Icom IC-F420-10, and theres quite a few others that will meet your needs.

GMRS allows no more that 50 watts of TPO (transmitting power output), and the frequency has 5 KHz spacing. (462.550, 462.575, 462.600, etc.) Repeaters receive on 467 and transmit on 462.

I guess I told you that to keep in mind for programming. It helps me once in a while when you get a little delirious with the programming that has to be done and you're not a computer wiz like others.

Try:

radios4sale@yahoogroups.com
www.rkleef.com

BTW, You have your GMRS license? Didn't see it. Most new guys aren't aware of the license that comes with the service. Just like the Amateur Radio Service, except without the test. Just file and pay through the FCC with a 605 (Schedule F) and 179 (payment) form or online with the ULS.

From: kvsp1160@aol.com
Topic: 10638 Message: 10699

Hi Wayne,

I might be able to help, with the extra help of a view of the GE Executive II radio.

This radio has two seperate systems operating independantly with each other: One Receiving module, One Exciter or Transmitting module. Controlling these modules is what's called the SAS board or the System-Audio-Squelch board. This is where it tells the radio when to transmit and when to receive. It also tells it when to encode and/or decode the preset tone(s) that you have installed (along with a controller if desired). With that said...

With this particular system, it decodes the audio, tones, etc, and retransmits everything back across on the new frequency. Now other new systems may just leave the received signal the way it is and resend it, but that does not guarantee that you will have the same tones or the same audio, etc. Therfore, it is the responsibility of the repeater to do just that: Take the information that it receives, translates into an audible signal and then retransmit that sugnal with the new tone, etc on the new frequency.

I have to apoligize that I did not directly use the technical aspects of your question, but I did understand what you were saying. Sometimes, when we look at a radio and try to depict how it works, it's really much more simpler than we make it sound.

10700. Re: [GMRS] Re: radio bandwidth and repeaters

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-11 00:22:03 UTC
From: Stephen Rice
Topic: 10638 Message: 10700

Hi Wayne, Most repeaters Receive the Tone from an early stage of the receiver and then filter out the tone by the time it is passed on to the receive speaker and on to the transmitter. The transmitter audio is mixed with a new tone generator ands sent out to your receiver. This is done for a number of reasons but one prime example would be is a split tone repeater where it would take a 104.1 tone in and send out a 94.7 tone. So the answer is a repeater does not reuse the tone . It decodes the tone from a device called a tone decoder and generates the tone from a device called a tone encoder. Something like a Dirty New Chevy going in the car wash and when it comes out it is a Clean New Chevy. Hope this helps. Steve

Realize though that these wattages numbers are meaningless. They have
no relationship to the amount of power actually leaving the antenna.
The recent Midland and Motorola bubblepack radios, in particular,
advertise wattage numbers that are very much larger than what is
actually being radiated.

Right, but is only for simplex operation only. I alomst bought it myself, as it is great for those who wish to have that option of using a base GMRS radio for simplex operation with WX (weather) frequencies. Does not have an external antenna connector though, and the wattage is low.

But great for your budget needs.

Topic: 10638 Message: 10705

Except for some (very) old RCA models that actually took the tone it received, cleaned it up, and sent it back out on the transmitter. Didn't work real well. And wouldn't do split tone.

Stephen: Split tone systems are unusual. Mostly it's to keep people from discovering the true input tone where there's the possibility of piracy or intentional interference. My statewide public safety agency does not use split tone, but a few of the local sheriff's offices do, along with DPL.

Walter

--- In GMRS@yahoogroups.com, "Stephen Rice" <srice3@c...> wrote:
>
> Hi Wayne, Most repeaters Receive the Tone from an early stage of the receiver and then filter out the tone by the time it is passed on to the receive speaker and on to the transmitter. The transmitter audio is mixed with a new tone generator ands sent out to your receiver. This is done for a number of reasons but one prime example would be is a split tone repeater where it would take a 104.1 tone in and send out a 94.7 tone. So the answer is a repeater does not reuse the tone . It decodes the tone from a device called a tone decoder and generates the tone from a device called a tone encoder. Something like a Dirty New Chevy going in the car wash and when it comes out it is a Clean New Chevy. Hope this helps. Steve

yup, I'm aware of that, actually just got the call letters in the FCC database this morning so when I posted that I was still waiting. WQEE732 is mine. That's what I was looking for was a commercial radio, I found a Kenwood TK-880 on eBay for a decent price and grabbed it so we'll see how that goes. It's 25watts. got a midland portable coming too I got a great deal on, programmed and everything for me. I'm ham radio operators well.

Well,

Let me think here... GMRS doesn't necessarily come in a base radio. Unless you buy a commercial radio like a GE Executive II Base radio (like I have). They're very cheap when you find them at the right time (around $25-45) plus $45 for a pair crystals.

(find them on eBay or at ge-mastrii@yahoogroups.com)

For mobile, I can recommend the Kenwood TK-840-D, Icom IC-F420-10, and theres quite a few others that will meet your needs.

GMRS allows no more that 50 watts of TPO (transmitting power output), and the frequency has 5 KHz spacing. (462.550, 462.575, 462.600, etc.) Repeaters receive on 467 and transmit on 462.

I guess I told you that to keep in mind for programming. It helps me once in a while when you get a little delirious with the programming that has to be done and you're not a computer wiz like others.

Try:

radios4sale@yahoogroups.com
www.rkleef.com

BTW, You have your GMRS license? Didn't see it. Most new guys aren't aware of the license that comes with the service. Just like the Amateur Radio Service, except without the test. Just file and pay through the FCC with a 605 (Schedule F) and 179 (payment) form or online with the ULS.

Okay, thanks Walter, Steve, and Ryan. The reason I asked the question is I was curious what might happen if one were to transmit to a repeater using 12.5 kHz bandwidth rather than 25 kHz. If the repeater simply mixed an intermediate frequency with a local oscillator to generate the transmitted signal, what it sent out should be a good copy of what came in. But since the repeater demodulates and remodulates, the quality of the audio will depend on the characteristics of those functions. I can imagine that a 12.5 kHz signal coming in would sound pretty bad when retransmitted.

It does not sound that bad, but the range is severly limited, as you need a very crisp and clear signal to make up for the fact that your PL Deviation is going to be half of what the repeater is looking for. If you crank up the PL deviation, then it makes the overall sound like crap.

If you keep a normal .5 to .7k deviation on a 2-2.5 k overall deviation, you definatly hear it.

We took over a customer that had crappy range on their repeater, but every time our service trucks tried it, operating on 5k deviation, it worked fine. They were running narrowband mobiles, and everytime they got any distance away, it went to crap. Close to their facility, they worked fine. The repeater was not narrowband.

For all of those radio techs out there that have horror stories
that they would like to share, I have started a new group at:
http://groups.yahoo.com/group/techstories .

This site is for the benefit of us tech that have had to deal with the
customers from hell. The "know-it-all" customers, the customers
that want to do their own installs and then wonder why a week later
the bring in their 100 watt radio with the finals burnt to a crisp and then
wonder why it won't be covered under warranty.

Admit it, you know exactly which customer I'm talking about and you
are just dying to tell someone else about it.

At present the group is non moderated, both for membership and
postings, HOWEVER if we start getting spam I will have to moderate.

What all do I need to know about GMRS?

Are repeaters multi-channel?
Can I use someone else's repeater?
Are they low-in high-out or the opposite?
What frequencies do I program into my scanner?
What do repeater-capable radios cost?
How much does it cost to program them?

I may have more questions as time goes by.

Hi Bil,

Here's the Answers:

Are repeaters multi-channel?
--> One frequency in; one frequency out.

Can I use someone else's repeater?
--> With permission, by writing emailing or calling them first. It's like using their car. You have to ask first since it's on their property. It may be free, or within a membership-based group.

Are they low-in high-out or the opposite?
--> Repeaters receive on 467.xxx, and transmit on 462.xxx.

What frequencies do I program into my scanner?
--> Simplex is on 462, and Duplex (or repeaters) are on 467. The decimal points are as follows:
550, 575, 600, 625, 650, 675, 700, 725.

What do repeater-capable radios cost?
--> Honestly depends on if you buy them new or used, but ranges overall between $30 to over $200.

How much does it cost to program them?
--> If you're budget is low and you're good with computers, you can do it yourself. Otherwise, you'll be paying service and hourly fees at your local radio shop. It's very simple to do. Now it the radios are older and require crystals, then you'll need a soldering iron and some meters. Might want to ask for help there from a friend or another ham or GMRS person.

Hope that helps. Getting a license is easier! 73...

WRONG!
Only program in the 462.xxx channels.
You typically won't hear the repeater inputs (467.xxx) unless you got
a REALLY advantageous location, which are incredibly rare around Phoenix.

10717. Why didn't this work? Stupid repeater experiment?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-14 01:44:12 UTC
From: Steve Smythe
Topic: 10717 Message: 10717

Okay. I have 4 simplex GMRS radios (Midland LXT435). For grins, I thought, "hey, I wonder if you can make a simple repeater with two radios in VOX mode on different channels."

So here's what I did.

Radio A (person) on channel 1 (462.5625 MHz)

Radio B (repeater) on channel 1 (462.5625 MHz) VOX mode

Radio C (repeater) on channel 22 (462.7250 MHz) VOX mode

Radio D (person) on channel 22 (462.7250 MHz)

I put B and C about 4 inches apart from each other in one room of my house.

I took A and D into another room and keyed A and got feedback from D.

What did I do wrong? Do I need to use cables between the MICs and EARs of B and C?

B EAR plugs into C MIC

B MIC plugs into C EAR

Isn't this a very simple representation of a repeater? Do the frequencies need to be farther apart?

Thanks for your helping me understand.

Date: 2006-01-14 03:34:40 UTC
From: pizza2002man
Topic: 10718 Message: 10718

Greetings,

I am trying to locate the FCC IDs for Motorola TX700 and T7200 radios.

Any help?

Also, at the FCC website, what report should I look for to verify ERP?

I tried to look up this info on a Midland radio without success. The FCC search provided about 25 reports and none of them had a title that could be used to guide me. I have a lousy 24k dial-up line would take hours just to download and check each document for a single radio. If I knew the title of the document regarding output it would be VERY helpfu.

Thank you, TR

Click on the link in the "Display Grant" column. That should provide
you with the information you need.

T7200 FCC ID: AZ489FT4853 ERP:.4 Watts Part 95B ERP:1.56 Eatts
Part 95A

That's the only one I could find. Sometimes searches can consume a
great deal of time.

John, That is helpful info. Thank you. It should save me hours of pointless and frustrating download time.

After re-reading your post I realized you provided the ID info for the T7200. Excellent!

Now I just need to keep searching for the infor on the TX700.

It's the antennas. When you have two of them close together they somehow cancel out each other.

It's done in the same way when using two HT's on a duplex repeater. You want to hear yourself on the repeater so you talk in one, hoping to hear out of the other. Not a chance. It's because the radios cancel out each other and can't receive that close.

Same thing as Jonny mentioned, but also has to do with the signal strength and the antennas.

I'd say use the same concept with what you have, but connect an external speaker to Radios B & C, and distance them apart. In this way, they'll have the space they need to perform their TX'ing and you might get better results. Also, if it's not raining where you're at, put them on the roof and try again (antennas pointing up). The higher the antenna is, the greater distance you'll get. And you might find better results with your experiment as well. Even in they are only a few watts. For a one story house, you might get a couple of miles easy. (above the buildings and over line of sight)

They are single frequency 5 meg split 467mhz input
462Mhz out. You can have multiple PL channels on each
frequency. I have 11 on mine.
> Can I use someone else's repeater?
With their permission.
> Are they low-in high-out or the opposite?
High-in low-out.
> What frequencies do I program into my scanner?
> What do repeater-capable radios cost?
Mine cost $20 for a mobile midland 530b, $25 for a
midland 530b Base, and $40 for a motorola HT
pre-programmed +with charger.
> How much does it cost to program them?
Programming for the midlands usually runs around
$20-30.

If you want a repeater you can usually build one
pretty cheap from surplus commercial gear, I have
about $120 invested in mine so far. It is a:

Standard rpt-2 repeater (467.675/462.675).
Cetec-Vega tone panel -w- 14 tone slots 11 used.
Henry UHF continuos duty amplifier set at 50 watts
out.
20 amp power supply for amplifier/ 8 amp supply for
repeater and tone panel.
Celewave 696-1-2 duplexers
7/8" andrews hardline
Polyphaser
Decibel products db-404b antenna.

By "feedback" do you mean radio D squealed as when you have a microphone in front of a speaker? If so, it sounds to me as if your repeater works. What audio came out D got fed back into A and made it around the loop.

It does sound like it worked, but it's unlikely to work well.

You have the basic concept right. Your specific setup probably wouldn't be super-useful but it does demonstrate the concept.

A real repeater setup has everyone transmitting on one freq. and everyone receiving on another freq. So you can have any number of people communicating. With your frequency arrangement it would only be effective for two stations, one on each frequency.. since let's say I have 6 stations:

A1, A2, A3
D1, D2, D3

Any A will head any D through the repeater and vice-versa but each A only hears the other A's directly. Same with D's. In a real repeater setup, everyone hears everyone else through the repeater. Radios will sometimes have a "talk around" button to change frequencies and bypass the repeater.. so nearby stations can communicate without the repeater.. if for example the repeater is malfunctioning or if both stations are out of range of the repeater but in range of each other.

Someone said something about the signals cancelling each other out. That's not really correct. The main problem is the transmitter signal overloading the receiver, even though they are on different frequencies. The signal from C will affect the receiver on B because the antennas are so close together. A real repeater uses filters to prevent this (the filters, called a duplexer, are so good that the two radios can share one antenna without interfering). Or, in the case that two antennas are used, they are positioned some distance apart and in such a way that they have as little coupling as possible. For example spaced vertically separated from each other on the same tower.

Try it with "A" and "D" operated by people in different rooms.
Try adjusting the volume on "B". Only 4 inches away it should be a fairly moderate volume.

Re using cables to connect them, conceptually that is right.. the problem is that the signal from the earphone jack is much too strong to put into the mic jack of the other radio. You would need an attenuator. Also, depending on the wiring of the mic circuit on your radio, connecting them like that might cause the radios to go into transmit mode and stay there. You might need a capacitor in the circuit. Basically you would need a small circuit to connect the radios in that way.

But if you had them connected correctly in that way, and the levels set right, and the antennas far enough apart, and high up.. then yes you would have yourself a functioning repeater.. one that worked on the wrong

frequencies, with very low power and bad antennas.. so I don't know just how useful it would be. But it would work.

I won't bother pointing out that your setup is illegal or immoral or something, I'm sure someone else will though.. and make a big scene. But not me...

But if you are interested in this kind of thing you should get a ham radio license, where this kind of experimenting is not just allowed but encouraged. It is really not too hard to get the first level of license (Technician Class). My friends 11 year old daughter just got hers.

the receive has to be a 467.XXX channel you can not use the 462.xxx for
receiver inputs as per FCC rules.

10731. Communications Stuff In Vermont

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-18 05:34:33 UTC
From: John
Topic: 10731 Message: 10731

Just wanted to invite other Vermonters in this group to visit our Vermont Communications Group where our topics include scanners, CB radio, Ham Radio and other related stuff.

We are at http://groups.yahoo.com/group/vermontcommunications

10732. Re: [GMRS] Why didn't this work? Stupid repeater experiment?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-18 07:51:51 UTC
From: kvsp1160@aol.com
Topic: 10723 Message: 10732

I mentioned the signals cancelling out each other. Not on the repeater it self, but on his experiment using the two HT's or bubblepacks. They don't have duplexers and weren't meant to be used in repeater operation. Since they are operating so closely together, the antennas can cause an electrical area (unseen) to allow the signals to cancel out each other when transmitted close by (within a few inches of each other.

The same when having two commercial HT's accessing a repeater system. Doesn't matter what the system is using, but matters where the original signals are placed and received that you get the results from.

If Radio A (in your left hand) TX's on 467.675, and Radio B (in your right hand) RX's on 462.675, the signals won't reach each other. This is because they are operating too closely together. Doesn't matter what radio or brand you use, the same results happen.

It's different if you're using a HT and a mobile because of the wattage and how the radio is programmed and built, plus the antennas are farther apart and also designed differently to allow this error correction occur.

With that said, this fully supports my original statement pointing towards Steve and his bubblepacks, NOT commercial radios operating within a repeater system (with equipment to withstand these type of issues).

10733. : Why didn't this work? Stupid repeater experiment?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-18 22:13:11 UTC
From: Steve Smythe
Topic: 10733 Message: 10733

Thanks everyone for the responses. It really was an experiment, and only did it once. I can see now why special dedicated repeaters are used and appreciate the concept of transmit on one, receive on the other. I can see I have a lot to learn!

I picked up a copy of "Now You're Talking" by the ARRL. There's a lot in there. I'm interested in learning about how it all works.

Are there any special requirements in setting up public repeaters? Will I need a license for just the repeater in addition to my family's license? Or would I be better off just using the existing Amateur Radio repeaters in the area? I like the idea of extending the capabilities of small radios that can be trashed while skiing or whatever. It sounds that the possibility of doing that is not realistic, so using higher quality devices is the path to follow.

Suggestions?

From: kvsp1160@aol.com
Topic: 10734 Message: 10734

Yes you can own and operate your own repeater system without an additional license. For myself, WPUI299 covers myself, my family, and my repeater system(s). No need to have any other license.

As for using bubblepack radios with repeater use, FRS just wasn't meant to be used with repeater systems. There are some bubblepack radios that have repeater-capable options, or you may use the simplex repeater unit that Radio Shack created, but only on GMRS.

On slopes and high mountains, like Lake Tahoe and other resort areas, FRS radios do tend to go very far. This is because of the altitude ad atmosphere that you're in. I've heard people from ski resorts 4-5 miles away while sitting on the shores in our cabins in the dead of winter. It can happen. (heard the location, so it confirms the distance)

Anyhow, I/we wish you the best of luck and maybe GMRS or ARS will be the right solution for your needs.

Hi Ryan,

I see what you mean, but your terminology seems to imply there is some strange phenomenon happening with the radio waves. There is not. All that is going on is that the energy radiated from the transmitting radio in your left hand overwhelms the receive circuitry in the radio in your right, preventing it from picking up the much weaker repeater signal.

I performed an experiment this evening with my T7200s. One radio transmitted on FRS channel one (2 watts) while an adjacent one received on channel 8, which is offset by exactly 5 MHz. Meanwhile, my wife was in the other room, around 50-70 feet away, and transmitted on channel 8 (500 mW) and my receiving radio picked it up just fine. When I changed my interfering radio over to channel 9 (only 25 kHz of separation), there was some interference with my wife's transmission but not a lot (the radios were all operating in wideband mode). So I'd say the T7200s have pretty good adjacent-channel rejection. They are, of course, completely shielded on the circuit board while many cheap radios have zero shielding except perhaps around the oscillator.

Hey Steve

As was mentioned, you don't need any special license to set up your
own GMRS repeater, just be mindful and co-operative with any other
GMRS repeater owners in your area regarding channel and tone
selections.

As far as the amateur repeaters in your area, keep in mind you and
any of your family members wishing to operate on amateur frequencies
must have a valid amateur technician class or higher license. I
prolly didn't need to mention this to you, but I just want you to
stay legal. Amateurs WILL hunt down pirates!

Good luck in your endeavors

Hi Guys,

Found this on eBay:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5855957944

Seems right on track (legal) with the specs. But is it worth buying for those who are just getting started in GMRS?

This is the in-between radio from a bubble pack to a commecial, and is cheap enough where if something happens to it, you can always replace it. Plus it comes with a charger and is programmable.

Thoughts, questions, comments, positives, negatives? I'd have to admit, it is better than that last cheap GMRS DTMF radio we saw on eBay last time... But again, in my opinion, it would be geared more towards the newer GMRS licensees.

Ryan asks: "How is it not legal? Power is fine, Spacing and deviation is fine, frequency is fine... Is it because the FCC number is not present?"

In a nutshell, yes. The radio has not gone through the "type acceptance" certification required by the FCC for all transmitting equipment (amateur radio equipment is excluded from type acceptance testing and certification requirements).

Chances are that this particular unit would never be FCC certified for one important reason - according to FCC requirements in effect for some 20 years, type certified equipment may not be "end user programmable". For this reason, ICOM will not sell programming software for type certified radios directly to the general public.

Not Type Accepted. No FCC ID. These radios are definitely NOT legal
for GMRS use.

Direct keypad entry of frequencies is a definite "no no" on GMRS. No
user-programmable capability is permitted.

The radio (like many other non-certified Asian made units) is probably a knock-off of another rig. It probably violates many patent and copyright protections (reverse engineered microcode and even copied circuitry).

The maker wont submit it to a lab for certification because that would expose the illegal use of another maker's patents and copyrights.

I used to see this in Asia.. Even the Chinese gov't was using locally made units that were obvious copies of mostly Kenwood gear.

This radio may or may not meet the spectral purity, bandwidth, and deviation specs. The most common problems seemed to be the radio's specs falling apart with changes in temperature and battery charge level.

Hi Ryan, Well the problem is that without a FCC type acceptance the radio is illegal to use in the United States ! This is because it has to be checking to show that it does not interfere with other communications systems. The number MUST be present if you are checked by the FCC or their representative. As a licensed radio operator you are responsible to be sure that the radio you are using is designed and certified for use. (In GMRS case part 95) Now there are people that have been suckered into buying these radios and then finding out they can not be used! The radio shown is a NanFone which is made in China . There are plenty of legal portable radios out there for less then 100.00 ! It is nice to be able to reprogram the radio from a keypad but I am quite sure you will find that if the radio is user programmed from the keypad on front it is not certified for use on GMRS. Good luck!

No FCC number, but maybe I am really tired from being up all night working.
How is it not legal? Power is fine, Spacing and deviation is fine, frequency is fine... Is it because the FCC number is not present? Do explain for me.

And.....because you got your license it means you agreed to use only part 95 certified radios and if caught using one that is not it is a $10,000 fine. If you had just blown off the license than they would confiscate the radio and give you an admonishment. Ouch. But actually the brands that have gone to the expense of getting certified are much nicer radios. Better software and no glitches in use.

Sec. 95.655 Frequency capability.

(a) No transmitter will be certificated for use in the CB service if it is equipped with a frequency capability not listed in Sec. 95.625, and no transmitter will be certificated for use in the GMRS if it is equipped with a frequency capability not listed in Sec. 95.621, unless such transmitter is also certificated for use in another radio service for which the frequency is authorized and for which certification is also required. (Transmitters with frequency capability for the Amateur Radio Services and Military Affiliate Radio System will not be certificated.)
(b) All frequency determining circuitry (including crystals) and programming controls in each CB transmitter and in each GMRS transmitter must be internal to the transmitter and must not be accessible from the exterior of the transmitter operating panel or from the exterior of the transmitter enclosure.
(c) No add-on device, whether internal or external, the function of which is to extend the transmitting frequency capability of a CB transmitter beyond its original capability, shall be manufactured, sold or attached to any CB station transmitter.
(d) No transmitter will be certificated for use in MURS if it is equipped with a frequency capability not listed in Sec. 95.632.

See section (b) " must not be accessible from the exterior of the transmitter operating panel or from the exterior of the transmitter enclosure."

This very issue has been discussed extensively at popularwireless.com

"Can somebody please explain the "programmable" part to me?"

Certainly. "Programmable" means that the radio frequency can be entered from the keypad or via internal circuitry. This is a "no-no" for the end user to be able to do via the keypad. The radios in question can be externally (keypad) programmed to any frequency in the transmit range of the radio. For this reason alone, these particular radios will never be type accepted by the FCC.

The only valid use for these radios in the United States would be in the amateur band 430-450 Mhz - and that is because amateur band radios do not need to be type accepted by the FCC.

A Hustler G6-450-3 is an excellent choice for a base antenna. It has a center frequency of 465, but covers 450-470. The antenna height is only 7 feet, handles 200 watts, has a 3 dB Gain, and has a male N connector. Bought one from a guy in this group for under $80. I'm using it for our repeater system. Can't complain here.

There are plenty of other antennas on eBay. Do a keyword search for: UHF antenna. And look under the categories of Radios..., and Industrial... when the results pop up. Always narrow your results with the lowest price first to get the best deal, and make sure to buy gear with high feedback scores and pictures (paypal preferred - not western union or money orders, as some are scams)

Also inquire at: radios4sale@yahoogroups.com for what you need. Chances are that there is someone who wants to sell theirs, but hasn't posted it yet.

It actually does not say in Part 95, no user programming or direct keypad entry of frequencies... Kurt's right.

So... Besides the missing FCC ID number, what else is against Part 95 (Subpart A & C) (B is FRS).

I'm very curious because the above is not stated anywhere within the rules unless someone can cut and paste the actual regs from the website with the web address for us to view.

Nevermind. I again correct myself. Long day. I hope you all understand.

And yes, I do realize what a FCC ID is and what the rules are for... for those who asked earlier. I've been licensed for a long time now and have no doubt or question about the rules and regs. It's the problem of being tired from work and the lack of sleep, that will drag you down and confuse you. Which makes you look bad...

I've been on here a long time and know my stuff. With that said, glad to hear everyone's opinion on the radio and look forward to our next discussions...

Someone did, Ryan. You must have missed it. Here it is again, compliments of "John":

Sec. 95.655 Frequency capability.

(a) No transmitter will be certificated for use in the CB service
if
it is equipped with a frequency capability not listed in Sec. 95.625,
and no transmitter will be certificated for use in the GMRS if it is
equipped with a frequency capability not listed in Sec. 95.621, unless
such transmitter is also certificated for use in another radio service
for which the frequency is authorized and for which certification is
also required. (Transmitters with frequency capability for the Amateur
Radio Services and Military Affiliate Radio System will not be
certificated.)
(b) All frequency determining circuitry (including crystals) and
programming controls in each CB transmitter and in each GMRS
transmitter
must be internal to the transmitter and must not be accessible from the
exterior of the transmitter operating panel or from the exterior of the
transmitter enclosure.
(c) No add-on device, whether internal or external, the function of
which is to extend the transmitting frequency capability of a CB

transmitter beyond its original capability, shall be
manufactured, sold
or attached to any CB station transmitter.
(d) No transmitter will be certificated for use in
MURS if it is
equipped with a frequency capability not listed in
Sec. 95.632.

See section (b) " must not be accessible from the
exterior of the transmitter operating panel or from
the exterior of the
transmitter enclosure."

10764. FRS, GMRS & Repeaters

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-23 15:59:44 UTC
From: Lyle Schultz
Topic: 10764 Message: 10764

After the latest efforts of someone's to build a homemade repeater a couple of thoughts come to mind.

FRS - Family Radio Service - by FCC definition is intended as a very limited, use and range "localized" system to support radio communication.

GMRS - General Mobile Radio Service" - by FCC definition is intended for a slightly higher level of radio communications. Where dependability and moderate range. Note the word "Mobile" in the definition from the FCC. By design and specification the transceiver is to function while moving about, i.e., on the highway at speed, across town, etc. To this end "repeaters" are allowed.

The FCC established Amateur Radio frequencies and rules as an opportunity to learn, experiment and develop new technologies using radio technology. This is the correct vehicle to satisfy your desire to experiment, try new ideas, modify and test radio equipment. The "Technician" license doesn't have any code requirements and requires a minimal amount of technical knowledge. That the first step if your truly interested in developing your radio knowledge

FRS is PTT radio, with GMRS is a next step using more powerful equipment in an expanded environment. Where misuse of the GMRS equipment and radio frequencies can cause disruption of other properly functioning radio technologies.

The gentleman mentioned he picked up an Amateur Radio book "Now Your Talking". He may not realize it but he has stumbled on to the answered his own questions. So if you want to experiment, modify and make changes to your equipment become a licensed amateur radio operator. With the basic knowledge required for the "Tech" license and the thousands books, articles, projects available from ARRL you will undoubted have a better success rate then functioning with an idea and little of know knowledge or source for information on radio technologies.

Remember the old data processing adage "Garbage in, Garbage out"! You get out of a project what you put into. Knowledge, or where to find the knowledge is the key to any successful endeavor.

Slightly higher? I think the jump from 1/2 watts to 50 watts, gain antennas, mobile radios, base stations, and repeaters is highly different than "slightly".

>Note the word "Mobile" in the definition from the FCC. By
> design and specification the transceiver is to function while
>moving about,
> i.e., on the highway at speed, across town, etc. To this

> are allowed.

Absolutely. One is also allowed the operation of base station radios, and like was quoted, repeaters. Both are fixed stations. Nobody should let the word "mobile" fool them.

Huh? Misuse of any radio service has the potential to cause interference.

>
> The gentleman mentioned he picked up an Amateur Radio book "Now Your

I support any person, whether or not they become a ham, to have fun with their GMRS equipment, as long as done legally. Its good to see someone getting interested in radio, whether or not they want to be hams.

With the basic
> knowledge required for the "Tech" license and the thousands books, articles,

You can also take that knowledge and expand your GMRS horizons also.

I thought that they were the 420-470 radios, not the FCC claimed 400-470 radios.

But at least this shows that the FCC is still awake to GMRS...

Yes that is the one! Funny, though, as you can see on EBAY he is still selling the radios. Hmm he did not like the feedback I left him when I bought two a couple of months ago for 35.00 each. Would not take them back and just left feedback..Hmmm well it was neutral so I responded he was selling illegal radios in the U.S.. Course what would be nice is if the FCC made them contact all their customers in the U.S. and refund them their money! There are others on there selling similar products. Course would be a real pain if the FCC got a warrant and confiscated the customer list for notices. Oh well that is why my 2 are sitting in a desk draw and I was lucky enough to get a good deal on a lot of New Old Stock Midland portables. Right now I am fighting a radio signal coming from a Child talking to his MOM every afternoon! Sure hope it is not one of these radios!!

From: Lake Hodges Radio
Topic: 10739 Message: 10776

The FCC should send their citation to eBay and eBay will revoke his selling privileges.

metamerchant is still selling these radios on eBay at this very moment.

Google: metamerchant and you can see his eBay listings...

Or, search eBay for Item number: 5858372188

Hey Steve,

If that Child and his mom are on GMRS and they never use their callsign, you have the right to ask what it is. If they don't have one, advise them that they are operating illegally and can be reported.

Plus it's very easy to track their signal down using the "triangle" method. using three points surrounding their approx location, then drawing lines on a map and when the lines cross, that's pretty much where they are. Now if the signal is mobile and not fixed, then it's more of a listening game for clues of where they are or what they're doing.

But that can be annoying. It's usually leftovers from Christmas, and will go away after a few weeks or so. The child becomes bored, or the parent becomes annoyed (whichever comes first), and they find another toy to play with. Kinda like the kid on the output of our repeater system here. You couldn't hear squat cause of the kid. And tried as I did to ask him to get off or change the channel, because we're "strangers" he ignored us and kept at it. So we had to wait for a few weeks til they got bored and left.

Good luck,
Ryan

Why have kits, when you can ask me for a copy of the programming software. Let me know if anyone here needs programming software for any type of radio. All you need is a PC and the programming cable. And I'll send you an attachment (.zip) of the software for your specific radio (program only, not for crystal-controlled).

I should have said the PC board kit.

I need the software to make a prom image for a Standard GTX1500 or the bin file for my freqs.

Well I am starting to narrow down the times so that I can set up in different locations! Its just a pain as he is bringing up the Repeater almost on every transmission. What is puzzling is that the input is 467.625 and they are talking simplex! I know that the child is probably male and comes from school around 3! Course in a 5000 home area it will take some time ! Maybe you are right and they will get bored. I have not been able to pick up the transmissions with the handheld as of yet. As to the Meta Merchant guy on EBAY I learned my lesson and always ask questions before buying! Still I did finally get the schematic from NanFone and maybe I can convert the radio to the 440 ham band instead of being a paper weight!

Hey Steve,

If that Child and his mom are on GMRS and they never use their callsign, you have the right to ask what it is. If they don't have one, advise them that they are operating illegally and can be reported.

Plus it's very easy to track their signal down using the "triangle" method. using three points surrounding their approx location, then drawing lines on a map and when the lines cross, that's pretty much where they are. Now if the signal is mobile and not fixed, then it's more of a listening game for clues of where they are or what they're doing.

But that can be annoying. It's usually leftovers from Christmas, and will go away after a few weeks or so. The child becomes bored, or the parent becomes annoyed (whichever comes first), and they find another toy to play with. Kinda like the kid on the output of our repeater system here. You couldn't hear squat cause of the kid. And tried as I did to ask him to get off or change the channel, because we're "strangers" he ignored us and kept at it. So we had to wait for a few weeks til they got bored and left.

Good luck,
Ryan

These program the radios that have the black rubber boot and the 10 pin IDC connector under it. XTR and Syntech II mobiles. With an adaptor to change the connector to a RJ45, will program Titan and Bantam radios.

You are correct, Joe. They are indeed usable as amateur equipment, but not for the services that they are being advertised for.

Hi Joe! Yes radios can be used by hams if they want to spend the time to convert the radios. If you look at the specs of the radio you will see that it is a 450-470 radio so does not cover any ham bands. It is still illegal to sell the radio in the United States. Hams that do find a radio that covers the ham band are responsible for the radios operation and spurious emmissions. Thanks Steve

10798. Can we please assemble a list of GMRS radios?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-28 04:12:32 UTC
From: Steve Smythe
Topic: 10798 Message: 10798

Can we work on putting together a list of all the radios (simplex and repeater capable) that work in the GMRS band?

Since I'm new to the whole GMRS band, I'm finding it very hard to get reference points on equipment and comparing what's what.

Has anyone tried this before? Maybe we can have a file in the group's file area that we could refer folks to?

Ideas? Thoughts?

that list would be so long it's not possible. There are just so many, but as long as it's FCC type accepted and you can check that, you're good.Even on eBay, most will help you with that even if you ask if you're not sure. I checked mine when I got them and when I get a cleaner base radio I'll check that as well, current one is nice and works but it's pretty banged up. Might go in my go kit though when I have money and get something nicer.

10800. FCC certification - Ham gear requires it

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-28 13:09:30 UTC
From: kb8fu
Topic: 10739 Message: 10800

Ham equipment still needs Part 15 certification for its receiver. If these cheap radios don't have it, they are not legal to use in the United States even if it is only as scanning receivers.

Find the FCC sticker on a typical piece of ham gear and then look it up here -

https://gullfoss2.fcc.gov/prod/oet/cf/eas/reports/GenericSearch.cfm

The only common exceptions are for home brew equipment (15.23) and kits (15.25). These still need to meet Part 15 specs even though they are not tested by a lab after assembly by each end user.

I do not think you are correct. As an amateur licensed, I may build and operate any radio. It is my responsibility to operate with in the guidelines of my privileges, spectral purity and interference to other services.

I think you are referring to the requirements for a manufacture to sell equipment in the US. Then it must meet minimum of part 15 to be sold.

You point to this in your links, it does only refer to the sale of, not the operating of. It is my license that depends on the proper operation of equipment.

Don't think this a flame I am just being a stickler. Just think of this, if I was using a receiver (and it is part 15 cerified)that was creating a spur on aircraft band and the FCC sent me a notice, I would have to shut down regardless.

Remember it is the government, it's all about taxes and certification fees!

Subject: [GMRS] FCC certification - Ham gear requires it

Ham equipment still needs Part 15 certification for its receiver. If these cheap radios don't have it, they are not legal to use in the United States even if it is only as scanning receivers.

Find the FCC sticker on a typical piece of ham gear and then look it up here -

https://gullfoss2.fcc.gov/prod/oet/cf/eas/reports/GenericSearch.cfm

The only common exceptions are for home brew equipment (15.23) and kits (15.25). These still need to meet Part 15 specs even though they are not tested by a lab after assembly by each end user.

If you hold an amateur radio licence, depending on the class of licence you have, you can build you own equipment.. You don't need fcc certification for that piece of equipment.... If memory serves me correctly, the only requirements you must follow are that your radio be stable, be free of spurious emmissions, below the power level of your licence.. and there are a few more....

Yes and I sent an earlier group message showing that home made is ok but manufactured for sale in lots greater then 5 is not. What I did not say and someone reminded me of is If the radio that I bought is modified by me it is no longer a Nanfone radio(true) and it can be used on the ham bands just like any modified GE,Motorola,Midland etc. as long as I am willing to risk my license on it. Thanks all the group for the input and I am going to modify the Nanfone radios (if possible) for the 440 band and if any one needs the schematic of the Nanfone Portable radio let me know. Steve

10806. Re: [GMRS] FCC certification - Ham gear requires it

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-28 15:41:23 UTC
From: Stephen Rice
Topic: 10739 Message: 10806

I have to admit that I believe that kb8fu makes a valid point as can be seen in the parts below from the part 15 information he provided and it shows me that I was incorrect about using the radios for ham use as these radios were not built by me as a ham and as such they fall under marketed radios. Well I don't want to beat it to death but I am sure that the Nanfone radios were not built by me so I can not say that good engineering practices were done in its constructon. I have 2 expensive paper weights.
Thanks Steve N4YZA -WQDW656

? 15.23 Home-built devices.
(a) Equipment authorization is not required for devices that are not marketed, are not constructed from a kit,
and are built in quantities of five or less for personal use.
(b) It is recognized that the individual builder of home-built equipment may not possess the means to perform
the measurements for determining compliance with the regulations. In this case, the builder is expected to employ good engineering practices to meet the specified technical standards
to the greatest extent practicable. The provisions of ? 15.5 apply to this equipment.

My original post said, in part, that "the only common exceptions are for home brew equipment (15.23) and kits (15.25)." Yes, hams can build their own equipment. I didn't say that they couldn't. What I said was only that commercially manufactured equipment, including ham gear, must be certified under Part 15.

With regard to certification of the receiver, we aren't talking about Parts 90, 95 and 97. Since the cheap radios that MetaMerchant and others hawk on E-Bay are not certified as meeting FCC requirements under Part 15 they are not legal to use in the United States, even as receivers.

ham's can import non-type accepted equipment and use
it on the air and even sell it to other hams. I
imported the kenwood tribander tm-2400 into the U.S.
from Japan through another ham. since the 2.4ghz band
module hasn't been type accepted in the U.S. yet. The
only restriction is I can't sell it to a non-ham. It
is just up to the individual ham to make sure that his
equipment doesn't cause harmful interference.

From: Michael Shaffer
Topic: 10739 Message: 10809

Go ahead and mod them Steve, hams are allowed to
import non type acceppted equipment and use them on
the ham bands. Alot of Hams import the 1.2ghz Kenwood
ht's and use them.

There used to be a question on one of the ham exams
about this. I think it was on the old Extra exam. I
haven't administered tests in awhile so I don't know
if it is still there.

If anyone is looking for a great radio to use for
GMRS, try the Motorola sp50+, I just had one
reprogrammed for GMRS and it works awesome. Best
sounding audio of any HT I have ever had.

I was not disputing that. There we do agree. What you are over looking is as a ham I may use anything for anything. It is MY responsibility to operate within parameters. Any radio I modify just by the act of modifying is no longer type accepted. Amateur radio is a pool of radio operators and experimenters. The points you are making only apply to commercial sales of electronic devices. Just like UL listing. The power supply I built is not UL listed, however that Astron better have a UL listing if you want to legally sell it in the US.

Subject: [GMRS] Re: FCC certification - Ham gear requires it

My original post said, in part, that "the only common exceptions are for home brew equipment (15.23) and kits (15.25)." Yes, hams can build their own equipment. I didn't say that they couldn't. What I said was only that commercially manufactured equipment, including ham gear, must be certified under Part 15.

With regard to certification of the receiver, we aren't talking about Parts 90, 95 and 97. Since the cheap radios that MetaMerchant and others hawk on E-Bay are not certified as meeting FCC requirements under Part 15 they are not legal to use in the United States, even as receivers.

From: Chris
Topic: 10811 Message: 10811

What does all of this have to do with GMRS? Lets talk type acceptance of Part 95 equipment and GMRS...getting off topic?

10812. Programming Software

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-29 21:37:44 UTC
From: kvsp1160@aol.com
Topic: 10812 Message: 10812

For those who contacted me directly, I'll reply back. So this doesn't pertain to you...

If anyone needs programming software for their radio, I should have it available to at no extra cost (FREE for those who need that in english).

It'll come in a .zip file and I can send it as an attachment via direct email. If you know the Make and Model number, that would be most helpful. Or even the program software Type, even better.

Just email me directly, not on the group, and I'll get a copy to you within a few days.

BTW, this is a one time offer, and I can't make any money off of it. So if you need a bunch that you think you might need, but don't really need, don't ask. Just ask for the ones you honestly really need.

10813. What radios do you use? Why? Don't Like? You Paid how Much (The other half!)?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-01-30 01:26:04 UTC
From: Ronnie & Steve Rice
Topic: 10813 Message: 10813

I have heard a lot about illegal radios but I would like to hear what people that are using GMRS Repeaters are using for Portable and Mobile Radios. What they like, what price range they paid, and what they did not like. I know people are going to say there are thousands of radios but come on folks it helps some of the newer people in GMRS to get an idea of what people think of a radio and a rough idea what it costs. I am tired of people in the area calling me to say they bought a GMRS radio and it won't work on a repeater! I know of NO Bubble Pack radio that works on repeaters! Do You? In talks with Motorola they have agreed to pass on to some of their people the idea of offering a pre-programmed repeater capable GMRS portable but suspect it will go nowhere. Ok folks I use a :

Midland portable 70-272 16 Channel 4 Watt in the range of $60 to $100
I don't like that it is big and heavy but the scan is nice.

M/A Panther 300m Mobiles 6 Channel 40 Watt Prices from $60 to $160
Plenty of power but lacks a lot of channels and no scan (Some need a lot of channels)

I usually base my purchases on price since I usually buy in small quantities.

Moderators if this is not an acceptable message for the group please let me know!
Thanks Steve N4YZA - WQDW656

Kenwood has a "bubble pack" gmrs repeater ready radio called the TK-3131. It has the frs/gmrs channels and the gmrs repeater channels pre-programmed. It also includes pl and dpl ctcss.

That will probably be my next purchase, I'll let you guys/gals know how it works when I get it.

Right now we have the following radios:
Midland 70 530b --- around $20 on Ebay plus programming
Motorola Ht220 --- around $20 on Ebay +crystals came with charger
Motorola sp50+ --- purchased for $75 on ebay programming included and came with charger

Motorola maxtrac --- $30 used came programmed

Standard repeater--- with tone panel, celwave 4 inch duplexers, 2 power supplies, henry amplifier, spare tone panel in cabinet already crystalled on 467.675/462.675 $100

Repeater Antenna Decibel products db-404b ---- free
Hardline for antenna --- $30
Spare Tpl amplifier (new) for Repeater --- $50 Ebay

There is alot of stuff out there for a good deal, you just have to look for it. I had a friend who just received a repeater and 8 motorola radios for free from a business who used to be on GMRS.

I thought the Motorola T7200 has the simplex AND duplex GMRS freqs as well as the first 7 FRS channels on there. Radio works the same as the T6500 and other FRS radios, but can also accommodate repeater access for GMRS... At least what I read a few years back and what I heard from some old members on this group.

Any truth to this, or was it just wishful thinking?

Also, I think the Cobra PR-7000 also has the duplex freqs as well. Any info on this would be great.

FYI, both radios have fixed antennas, so the wattage is low (.5-1w). Not worth buying in my opinion.

From: Ben
Topic: 10813 Message: 10819

The Moto T7200 is repeater capable and also has the FRS channels. Uses 4 AA batteries, fairly small, very light weight and doesn't require any programming. So if you are looking for an easy entry to repeater operation but with the convenience of a bubble pack it's a good choice. Commercial radios do work better but what people don't tell you is sure, you can get great radios for $50-$100 on ebay, but they resemble a lead brick. And plan on spending another $50 or so if you want a spare battery, or need to replace the ancient battery that comes with your ebay find. Small, cute commercial radios with fresh batteries cost a LOT more.

the first 7 FRS channels on there. Radio works the same as the T6500 and

other FRS radios, but can also accommodate repeater access for GMRS... At least
what I read a few years back and what I heard from some old members on this
group.

Any truth to this, or was it just wishful thinking?

Also, I think the Cobra PR-7000 also has the duplex freqs as well. Any info
on this would be great.

FYI, both radios have fixed antennas, so the wattage is low (.5-1w). Not

worth buying in my opinion.

Here's a link to the manual for the T7200 radio. It contains a decent explanation of the repeater function.

http://www.motorola.com/mdirect/manuals/T7200_User_Manual_E.pdf

The Moto T7200 is repeater capable and also has the FRS channels. Uses 4 AA batteries, fairly small, very light weight and doesn't require any programming. So if you are looking for an easy entry to repeater operation but with the convenience of a bubble pack it's a good choice. Commercial radios do work better but what people don't tell you is sure, you can get great radios for $50-$100 on ebay, but they resemble a lead brick. And plan on spending another $50 or so if you want a spare battery, or need to replace the ancient battery that comes with your ebay find. Small, cute commercial radios with fresh batteries cost a LOT more.

Well see I learned something already! Did not know that Motorola or Kenwood had a Repeater Capable portable FRS/GMRS radio! If you ask them as I did the other day they say they do not! I am trying to make a list of radios as we go along. Keep them coming and we will see if there are more that I and others did not know about! Thanks all for helping with the list so we can pass it on ! I am also keeping track of model,manufacturer,requires programming(y/n),channels,repeater capable(y/n),Newer model(y/n),Price Range.

The Motorola T7200 has simplex & duplex GMRS freqs as well as the 7 FRS only channels. It's a good bang for the buck.

I use nothing but Kenwood commercial radios. Mobiles are TK-805D's. Primary hand helds are TK-390's plus a TK-360 radio I use as a throw radio (extra from family member).

Prices, never paid over $125 for the mobiles. Paid $200 each for two of the TK-390's and $100 for the third. About $60 for the TK-360. Ease of finding programming cables and software are the reason I chose Kenwood.

Hi!

Motorola may or may not make the T-7200 anymore. It is a repeater capable HT with all the GMRS/FRS frequencies. It does not have the digital tones, only the analog tones. I have 4 of these for my family GMRS repeater. I also have 2 Midland 75-440 HT's and to compare the two, the Midland radios definitely sound better than the Motorola's. But the Midland radio's do not have the 2 watt power as advertised, they only output 1 watt (buyer beware). Another feature of the T-7200's is FM inversion which scrambles the signal preventing some other people from understanding your traffic. The radios are part 95 type accepted so I assume that the scrambling is legal. But the audio quality is so bad you probably wouldn't use it anyway. They also cost 4 times more than other bubble pack radios.

73,
Cris

Hey all,

Last call on the SP50's. $68each in lots of 2 or more.

Have 25 standard/full size units in UHF 10ch radios with
standard chargers, not sure on batteries of course, and programming
included
if necessary.
Radios are in average used condition with the only problems being
battery door slide-locks missing or bad battery door. Tested for pwr on,
tx/rx and all are working fine.

Pix available.

thanks!
Randy

Are there any packs that:
- Have good sound quality
- Output 2W from the antenna
- Run for a decent while on rechargeables (AAs or AAAs)
- Reasonably light-weight (so I can pin it on the kids)
- Reasonably rugged (The midlands I got from ebay lose sync after being jarred)

The "weigh like a lead brick" that another poster mentioned is one of the reasons I hesitate to get "commercial" models from ebay (that and the fact that I often get lemos from ebay, like the aforementioned Midlands).

Thanks.

In my opinion the T7200 meets all your requirements except perhaps for pinning it on the kids. It has better sound quality than any other bubble-packs I've heard (especially in wide-band mode) and can get quite loud without distorting. Judge for yourself on that. I believe the reference to really poor audio quality only concerns scrambling mode--but I've never tried it. The T7200 is a 2W radio and will run all day on one charge (longer still if you forgo Motorola's battery pack and buy 2500 mAH or better individual cells). It is larger than the FRS radios you see every day in the store but is not a lead brick, and it comes with a belt clip that I think works well. Rugged: certainly good enough for family use. I would not chock a train with it though!

I used to own Kenwood Freetalk WX FRS radios and thought at the time they worked pretty well, although they distorted at any kind of volume

and sometimes would start whistling/motorboating before the batteries were depleted. I used to buy expensive lithium batts when using those radios at the ski hill because NiMHs and alkalines drop their voltage in cold temps. When I bought my T7200s I realized what junk those Kenwoods were. The T7200s keep working with the battery voltage way way low and the standard NiMH pack works just fine in all temps.

I only have two complaints so far about the T7200: that the standard charger is an overnight wall plug type and you can't really control whether you overcharge the battery pack, and the lack of a "received signal" indicator. The radio does not give a visual if someone else with a different PL tone is transmitting on your frequency, and the only way to determine that is to turn off the squelch, which causes you to be blasted with noise if nobody is transmitting. There is a little antenna symbol on the display that Motorola should have used to indicate RX.

As a disclaimer, I'll state that my radios are used by my family and we probably are not as demanding as the really really serious folks who like to demean them. The T7200s are not as nice as the Jedi I used to carry around when I worked at Motorola's Plantation facility, but then they don't cost as much either!

Wayne

10830. Re: [GMRS] RE: What radios do you use?

Topic: 10828 Message: 10830

If you like Icoms, the IC-F21 HT's are great and don't weigh alot either. Easy to use, but the downside is that the tones are preprogrammed in already.

Motorola GM300's are great as well, but they tend to be on the heavy side. However, I have dropped them from high places and have been through storms and still work like new. Great audio, never distorts. Batteries last throughout a 12 hour work schedule, but suggest to recharge after 8 hours.

Or if you can still find them: Pryme PR-460 (and the PR-460-D) are also great radios and allow you to change channels and tones on the fly. Seperate tones for each channel, and you can turn on/off tones for TX and/or RX of each channel, has scan, call button, squelch, light, and a BNC antenna jack. Battey sizes are either the 10-hour, 14-hour, AA pack, and charging with drop-in or wall options. Each for around $60-$110. (PR-460-D has the DTMF pad. Allows group and caller paging options, with standard DTMF operations for repeaters.

For mobile's, the only one I've used is the Icom IC-F420. Programming from your PC, and the rest is easy! Has 6 total programmable buttons, but two of them are dedicated up/down buttons for extra features. May include the SmarTrunk Mode for more channels and features. Also has internal modem connections for packet (ham, etc only). Has timer, DTMF ID, Memory, and everything you'd want from a radio. All within your grasp! Got mine from eBay for only $140. The antenna is a converted center-coil whip (CB), which gives me a 2:1 ratio and a 2dB gain. Can't ask for anything better...

And that's my 2 cents for the morning. 73!

Do you need repeater capability? You didn't mention that, was that supposed to be implicit?

If you don't need repeater capability then the Cobra PR4000s have much better sound quality than the bubblepack Motorolas and have 2.1 watt ERP.

From: chuckworkb
Topic: 10833 Message: 10833

Here's what I want to do -

I have a family of five that won't study for a ham license, but wants to talk on the radio so....
I had the idea that I could get them setup with GMRS radios, and a repeater so when we go off on camping and hiking trips we could all communicate reliably. I thought I would run the repeater from 12 v batteries in the back of my truck, with an antenna mounted to the truck when I needed it.

I hate the FRS bubble pack radios so I felt that GMRS or MUHRS was best and Muhrs radios are hard to come by.

So,any input /ideas would be greatly appreciated, thank you in advance.

If you think this can't be done then tell me that as well.

It can, but even using GMRS simplex in the woods does have a range of 1-2 miles. At least it does on my Pryme PR-460's. There is a vehicle repeater made just for that on eBay right now. Type in keyword: uhf repeater

The only thing is finding a way to program it. The rest is easy for the antenna and radios.

Or even a base repeater with a voltage conversion, but could drain your car battery... Maybe a generator during the day? And bubblepacks at night when close by?

I once hooked up a discone base antenna with a GMRS HT, and we could talk farther and receive very well. May be an alterative solution to a repeater.

Or even using fishing line and hauling your antenna up a tree to gain height... another thought. Use your imagination as long as you stay within the rules. And have fun with it!

I buy all my radios new. I only have experience with the Midland 75-440's and the Motorola T7200's. I can't attest to the performance of any other GMRS radios, because I haven't used any others. The Midlands cannot be field programmed and must be programmed with a PC. The software and the cable was an additional cost, which was rather significant. In fact, the dealer actually sent me a "second hand" radio when I ordered the second one. He refused to cross ship a new one and didn't refund the shipping charge until I asked for it. Be careful when purchasing from small internet only radio dealers!

10836. Re: [GMRS] what do I need to setup a small repeater in my vehicle

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-02 05:39:41 UTC
From: Cris David Salanga (KU6A)
Topic: 10833 Message: 10836

That's exactly what I did! I bought a repeater controller, 2 tranceivers and a duplexer and built my own GMRS repeater for family communications. I made mine from mobile radios end housed them in a pelican case. I normally have it running from my house and can easily move into my truck when we go to theme parks. The repeater and HTs cost me about $2000 and although the system works flawlessly, it doesn't work very well when "everybody and their brother" uses bubble pack radios on GMRS frequencies.
I ended up getting my 10 yr old son to pass his ham license exam and now we have higher quality radios and share frequencies with operators that are polite and free from the foul language I hear on GMRS.

73,
Cris
KU6A

Not all business's are created equal! There are ways around some of the regulations that some companies could do and it is very simple. Just reimburse each employee for them to apply and receive a GMRS license. As they are each licensed entities they are then allowed to communicate among stations without any problem. As has been pointed out earlier by some is that on GMRS you can talk about anything from work to tonight's party. I just wanted to point out that there are ways a business may be able to do it. But at least they would identify! I have some place near here that is using GMRS for maintenance and I have yet to get an ID so have been having to track where the signals are coming from.
Thanks Steve

From: kvsp1160@...:
"If you like Icoms, the IC-F21 HT's are great and don't weigh alot either.
Easy to use, but the downside is that the tones are preprogrammed in already."
Ryan, I think you have mixed up the F21 with the some other Icom portable. The F21 is a LMR (Land Mobile Radio) that comes in a 2 or 16 channel version's that must be programmed via a PC using the Icom software.

"Motorola GM300's are great as well, but they tend to be on the heavy side.
However, I have dropped them from high places and have been through storms and
still work like new. Great audio, never distorts. Batteries last throughout a
12 hour work schedule, but suggest to recharge after 8 hours."
I will agree with your statement that they are a great radio, and really agree with you about them being heavy! I'll bet that they are a bit awkward to operate, what with holding on to the unit, somehow suspending the antenna out of reach and then trying to key the mic! Quite the ordeal! What kind of batteries are you using and how are you carrying them?? It must be quite the site to see you walking down the street trying to operate that MOBILE radio!

Hi Alex, yes we are just looking for repeater capable radios for now since these seem to be the most difficult to find. I should of been more explicit. But thanks for the input on the Cobras. Steve

Got to be honest if it costs $2000 to do this I won't be doing it.
I use the GMRS often but not enough to warrant spending 2000.

Thanks for the ideas though I appreciate your ideas and input

Maybe if I could find something small in size, and even if I have to
home brew some parts it would be OK, but it is probably costly and may
not be worth it, as i look at the prices for the repeaters - I can
just imagine the look on my wifes face if she saw a bill for over $100
0 for us to talk on the radios she would freak!

Take a look at this repeater looks good for the price.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=7587300288&fromMakeTrack=true

also search uhf repeaters on ebay there is a good
selection

I know just my base setup I put in a lot of money and I got a banged up used radio but it works, I'd like something nicer and newer but I can't afford it. I can't imagine putting up a repeater though knowing me I'll try it down the road. I'm just flat out broke right now due to a few things going on.

From: Stephen Rice
Topic: 10833 Message: 10845

Hi CB, all a repeater is a receiver and a transmitter connected together with a controller and fed into a duplexer. Now lets look closely at your problem
1. You need 2 Transceivers (maybe a 20 or 30 watt mobiles average price from 20 to 300 each)
2. A controller card with ID (These average 120.00 new)
3. A duplexer (This is the item that you will have to hunt for because a good duplexer can run from 150-300.
4. An Antenna for the repeater (I paid 65.00 for a new 5/8 ground plane) or build your own.
5. Coax Cable to goto the antenna (Make sure it is good coax such as at least 9913) Hard line not needed

Hmm so lets add it up for a rough idea
2@40 transceivers
1@120.00 Controller
1@225.00 Duplexer
30@1.00 Coax and connectors
1@65 Antenna

So we have $520 for a repeater plus a lot of labor to assemble the equipment minus a lot of fun doing it.
I have seen the complete Motorola GR300 repeater with duplexer selling for 500 sometimes so then you would only have to worry about the antenna and coax. Also many other assembled repeaters around at a lesser price but you have to take the time to look.

It was only about $1100 for the repeater. The rest was for HTs

Ya know how people have really long days and hit the wrong key on their computer keyboard? And then feel like a total idiot after someone else points out their stupidity?

That's how I feel. Thanks Ty!

The HT versions of both the Icom (?-21) and Motorola (GR300) is what I meant to put in. Although it would be funny to see me walk down the street with a mobile in my hand, lugging batteries behind me... =c) But the other Icom F-420 is a real beauty to have in my truck. And is used as a mobile.

Nope. The one on eBay is just under $200.00. Should be right within your budget.

From: kvsp1160@aol.com
Topic: 10833 Message: 10849

Even though this isn't for a vehicle, I thought I'd share what it could take to build a simple repeater.

One of my complete setups is this:

- GE Mastr Executive II Base Radio (repeater conv. to 50w): $65
- Zetron Model 38A Repeater Controller (CWID, CTCSS/DCS, DTMF, etc): $145
- Decibel Products DB-4072, 6-cell Duplexer: $90
- Hustler G6-450-3 Base Antenna, 7ft, 3 dB Gain: $80
- Andrews LDF4-50A Coax, 7/8" heliax @100ft: $800 (free in trade for use of repeater system)
- Misc jumpers, tone boards, test equip, etc: $60

So in total, roughly it cost me $440 (or $1240 if I paid for the coax). All I need is a tower, and confirmation of my site.

The tuning and installation was easy, repeater conversion was simple, and all it took was a few hours each night, and I got it all done. Oh, everything you see above (except the coax) was purchased off of eBay.

If you do your research, hunt for the right price and bargains, anything is possible. And when you're all done and you did everything correct, your system will work as good (or better) as a commercial system.

Folks,

Thanks for more info on this - I will continue to look and see what I can find - I have to put my bargin hunter hat on and surf ebay.

There is a lot of good info in all your replys maybe I will get this done.

Thanks

CB

Radio Shack made a simplex repeater a while back. It worked like this. You send your message on your HT, bubble pack radio with repeater plugged into the mic and external speaker jacks in the car with an external antenna receives ,records then plays back and retransmits your message on the same frequency. With the RS version you had a 20 second limit to leave your message. It sounds very short to some but if you try it you will be surprised how much you can send in 20 seconds. I own one and use it quite a bit for the same reasons you planned to. It has a 12vdc input and also runs a long time on 4 AAA cells. Try e-bay Hamfests or groups to locate one as radio shack does not stock them anymore. KB1CHU

What part of Massachusetts? I don't know how to obtain perdition to use them yet but there are a few I know of, and the mass notification network is a good place to listen to what's going on. I listen to that a lot when I'm not doing much else. 462.6 or in some areas 462.55 but I think 462.6 is more commonly used.

Mass Net has several repeaters ,as do we TAC-7, but
they are closed for menbers only.I don't think there
are any open repeaters in MA.

Just a discouragement not to use these on FRS radios. Only GMRS frequencies.

Careful, this "solution" is just a way around the rules...Ultimately, if the FCC believes that the system is being used for a group or entity then it could be shut down. Besides, the costs to coordinate a IG system is far cheaper then putting an entire staff on GMRS with their individual licenses. About four GMRS license fees cover the costs to coordinate a legitimate business system.

Keep in mind the FCC's definition of "family use" and "facilitates the needs of a family". This is a strong point to remember the purpose of GMRS.

--- In GMRS@yahoogroups.com, "Stephen Rice" <srice3@...>
wrote:
>
> Not all business's are created equal! There are ways around some of the regulations that some companies could do and it is very simple. Just reimburse each employee for them to apply and receive a GMRS license. As they are each licensed entities they are then allowed to communicate among stations without any problem. As has been pointed out earlier by some is that on GMRS you can talk about anything from work to tonight's party. I just wanted to point out that there are ways a business may be able to do it. But at least they would identify! I have some place near here that is using GMRS for maintenance and I have yet to get an ID so have been having to track where the signals are coming from.

Topic: 10833 Message: 10858

Hi all,

Here is a really cheap recipe for a repeater. You
will need:

Harris RF IMTS Radiotelephone (These are already
duplexed and come with duplexers) They put out about
20-25 watts pre-duplexer. They cost used 30-60
dollars.
You can either get these in programmable or
rock-bound models.

NHRC Controller-- I bought the kit model and put it
together myself, I think the cost was around $40.00

I put one of these together and tuned it down into
the Ham bands for portable use and they work great.
For emrgency use just hook into the vehicles power and
hook to an antenna and your on the air.

Mike

10860. Re: [GMRS] Re: what do I need to setup a small repeater in my vehicle

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-05 19:32:04 UTC
From: Michael Shaffer
Topic: 10833 Message: 10860

The Harris rf units are Type accepted for GMRS. I had
to convert mine for Ham. No conversion neccessary for
GMRS.

Three used Vertex VX160 UHF 450-520mhz portable. Radio has "ALU" engraved on fron, but otherwise in excellent condition. 16ch, 4 watts. Radio comes with lithium ion battery, belt clip, stubby antenna, and a rapid rate charger. The charger is for battery only. Looking for $225.00 each. I will take $600.00 for the three. If you purchase all three I will program and ship them for free.

Look at this small repeater/duplexers on Ebay. It is on ham bands but
you could pop 2 GMRS crystals in it.

GR300 UHF Repeater ... For Sale!

Extremely good condition. Complete with two GM300's, built in Power Supply, Duplexer and Portability Kit (steel front and rear covers with handle, see Hi_Res pics at the link below).

http://www.flickr.com/photos/bee-s/sets/72057594063815481/

Powers up ... checked out, fan, Tx, Rx, everything works.

Currently programmed to 464.5/469.5

Tx: 12.5 watts out of duplexer
Mod: 4.7

This puppy, with portability case, weighs out at close to 45lbs ship weight.

View Hi-Res Pics at URL links above and below.

http://www.flickr.com/photos/bee-s/sets/72057594063815481/

These are pictures only! Nothing more. Letting you see what I'm offering (in extreme detail allaround) so there is no doubt what you're buying.

Price: $600.00 plus shipping

PayPal Accepted

that's a very broad question, you can spend a little for bubble pack radios and if you want t stay with in a few miles of your family or who ever you talk to that works, if you want to get really in to it, you can spend as much as you want.

Hi Guys is there a general list of Repeaters state by state?
Im looking For a system in New jersey to use.
a friend used to have one But looking up his license in the FCC database Its Expired...
Also I have a set Of Motorola Talkabout T5920 FRS/GRMS walkie talkies with 22 Channels Figuring some are FRS Frequencys and some are GMRS. I can hear a repeater ID'ing But I dont think these radios have the Offsets to operate On repeaters. Does anyone know??
Thanks in advance
Neal

10875. Re: [GMRS] Repeater lists

From: John Miller
Topic: 10874 Message: 10875

they probably don't. I haven't seen an updated list of repeaters in a long time, I was looking for some in my area and a scan is the only way I found any, scanning on my scanner, then I get my radio programmed and find another one I should have had added and don't know where to take my base around here to be reprogrammed. I have the program to do it and cable but my computer has XP and no real version of Dos I know how to access so I can't program it that way since the program is a DOS program.

10878. Re: [GMRS] Repeater list

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-21 19:39:38 UTC
From: Allen Rossi
Topic: 10876 Message: 10878

I have a question for the List. I have recently purchased a Garmin Rino 530 which has GMRS frequencies on it. I have also received my FCC license to use them. My question is what does it take to setup a repeater to use these frequencies with the data that Garmin Rino's send. The local repeater around here does not seem to transit the mapping data that these Rino can produce. I would like to know for SAR applications.

Thank you,

Allen Rossi

Looking for any info on how to get the Midland G-82 to do repeater splits.

Thanks
John

Windows XP has a function that allows you to run "old" windows
program on XP. You just select the program and tell XP what
version of windows (Windows 3.1, 98, etc.) Maybe you could look
and see, MAYBE it has the ability to run an old DOS? Can't hurt to
look.
It's called the Program Compatibility Wizard.

My question is what does it take to setup a repeater to use these frequencies with the data that Garmin Rino's send. The local repeater around here does not seem to transit the mapping data that these Rino can produce. I would like to know for SAR applications.

At this time, it is not permitted to send data through a repeater with a Rino, thus the reason why the unit will not do it.

Hi Chris,

A simple way to foxhunt with a handheld is to buy a yagi antenna from HRO or eBay that's made for the 440 or the 450-470 bands. You're only receiving, and unless you're the fox, you won't need to bother with tuning that antenna. A good 3-, 4- or 5-element yagi antenna is a good start and they're not too expensive. On eBay, they run at around $69. At HRO maybe a few dollars more or less.

If you really want to go cheap and don't care how you look (and don't TX on the antenna), the VHF portion of an outdoor TV antenna is another great item to use. This is not the radial section, but the V-shaped yagi section off of the back of the antenna that picks up channels 2-14 on your TV set.

I also build a yagi antenna from coat hagers from the local cleaners, and attached a SO-239 to the end. Worked very well for receiving, but not too well for TX'ing.

Again, foxhunting is for receiving, so any type of fixture or antenna that is directional will work. (maybe a cellular 800MHz yagi?) No matter what the max wattage is. As long as you don't plan on transmitting.

Another trick is when you get close to the fox, use the rubber duck and hold the radio close to your chest to block some of the rf. Turn around and when the signal is loudest you are looking in the direction of the fox. have fun

10889. GMRS Informational Broadcasts Use

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-25 18:36:20 UTC
From: David W Proshek
Topic: 10889 Message: 10889

I am a licensed GMRS user (WQEI-828). I live in a rural area of Putnam County, Florida. I am a severe weather watcher and emergency monitor enthusiast. I know many people in my are who monitor and use GMRS and FRS radios. I am setting up a Community Weather Emergency Notification System, utilizing the GMRS/FRS Channel 1 (462.5625) for severe weather announcements. I will be sending out written notices to all in the community that they can monitor this frequency for this information. (If they dont have FRS radios, they can listen on scanners). My question to the members of this group is: Since GMRS and FRS is for family communication, what I am doing, is it legal per FCC regulations? I am operating from a base station (Audiovox GMRS-2000)of a maximum power of only 2 watts, with a roof-top antenna tuned to the GMRS frequencies, so I have a range of the sub-division community I live in. I am also looking to set up a Neighborhood Watch program. Am I okay? I look forward to any comments. Thanks.

This is a "broadcast", a message not intended for two
way communications.

I was going to say such transmissions are forbidden by
regulations. However, there seems to be no rule
stating these types of transmissions are forbidden.
The regs state over and over about two way
communications. You could assume any type of
transmission NOT listed in the permissible
communications in Sec. 95.181 would be in
violation..... OR you could assume since it is not

specifically stated in Sec. 95.183, then it isn't
against regs.

Here are the regs mentioned above:

Sec. 95.181 Permissible communications.

(a) A station operator for an individual who is
licensed in the GMRS
(other than an employee of that individual) may
communicate two-way
voice messages concerning the licensee's personal or
business activities
(see Sec. 95.179).
(b) [Reserved]
(c) A station operator for any entity other than
an individual
licensed in the GMRS may communicate two-way

[[Page 531]]

voice messages concerning the licensee's business
activities (see Sec.
95.179). An employee for an entity other than an
individual licensed in
the GMRS may, as a station operator, communicate
two-way voice messages
while acting within the scope of his/her employment.
(d) A station operator for any GMRS licensee may
communicate two-way
voice messages concerning:
(1) Emergencies (see Sec. 95.143);
(2) Rendering assistance to a motorist; and
(3) Civil defense drills, if the responsible
agency requests
assistance.
(e) All messages must be in plain language
(without codes or hidden
meanings). They may be in a foreign language, except
for call signs (see
Sec. 95.119).
(f) A station operator may communicate tone
messages for purposes of
identification or transmitter control in a control
link.
(g) A station operator may communicate a selective
calling tone or
tone operated squelch only in conjunction with a voice
communication. If
the tone is subaudible (300 Hertz or less) it may be
communicated during

the entire voice message. If the tone is audible (more than 300 Hertz) it may be communicated for no more than 15 seconds at a time.
(h) A station operator may communicate a one-way voice page to a paging receiver. A selective calling tone or tone operated squelch may be used in conjunction with a voice page, as prescribed in paragraph (g) of this section. A station operator may not communicate a tone-only page (tones communicated in order to find, summon or notify someone).

[48 FR 35237, Aug. 3, 1983, as amended at 49 FR 4003, Feb. 1, 1984; 56 FR 13289, Apr. 1, 1991; 63 FR 68976, Dec. 14, 1998]

Sec. 95.183 Prohibited communications.

(a) A station operator must not communicate:
(1) Messages for hire, whether the remuneration received is direct or indirect;
(2) Messages in connection with any activity which is against Federal, State, or local law;
(3) False or deceptive messages;
(4) Coded messages or messages with hidden meanings (``10 codes'' are permissible);
(5) Intentional interference;
(6) Music, whistling, sound effects or material to amuse or entertain;
(7) Obscene, profane or indecent words, language or meaning;
(8) Advertisements or offers for the sale of goods or services;
(9) Advertisements for a political candidate or political campaign (messages about the campaign business may be communicated);
(10) International distress signals, such as the word ``Mayday'' (except when on a ship, aircraft or other vehicle in immediate danger to ask for help);
(11) Programs (live or delayed) intended for radio or television

station broadcast;
(12) Messages which are both conveyed by a
wireline control link and
transmitted by a GMRS station;
(13) Messages (except emergency messages) to any
station in the
Amateur Radio Service, to any unauthorized station, or
to any foreign
station;
(14) Continuous or uninterrupted transmissions,
except for
communications involving the immediate safety of life
or property;
(15) Messages for public address systems.
(b) A station operator in a GMRS system licensed
to a telephone
answering service must not transmit any communications
to customers of
the telephone answering service.

[63 FR 68976, Dec. 14, 1998]

Essentially, this is yet another rule up for interpretation.

Just call these 'broadcasts' one-way paging, and it fits paragraph 'h'. And paragraph 'g' even permits sending an alert tone prior to the 'page'.
Just don't do this by any automatic means. That is, don't hook it up to your weather monitor and have it send these 'announcements' without direct intervention of a control operator. And don't forget to ID since you're using GMRS power levels and accessory antenna.

I do NOT believe GMRS or FRS radio operators are legally able to broadcast transmissions on the air for any purpose.. It is strictly for two way communication, and that is it !!

10896. GMRS Informational Broadcasts / 1 of 2

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-28 00:38:50 UTC
From: Lake Hodges Radio
Topic: 10889 Message: 10896

Lee is right. No broadcasting is permitted.

You get around it like this: You, David, call your friend Bill using your call signs. You say "Hi, Bill." Bill says "Hi, David." Then you send him the weather alert that you want to send him. This is a two-way communication. If someone wants to listen to you on an FRS radio or a scanner, that's allowed.

Good luck!

10897. GMRS Informational Broadcasts / 1 of 2

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-28 00:50:48 UTC
From: Lake Hodges Radio
Topic: 10889 Message: 10897

David...

Here are three more options...

1) You could operate a Part 15 unlicensed radio station on the AM radio broadcast band. 1610 KHz and 1700 KHz are often good frequencies to use. Depending on several variables, you can legally get one to two miles range with 100 milliwatts RF output and a 10-foot antenna. In a dense area, that could be thousands of potential listeners. You can legally rebroadcast the Weather Service's weather advisories taken from 162.400 MHz (and similar WX channels nearby). You can break in and broadcast your own live comments as you wish on your 100 milliwatt AM transmitter.

2) Or, you could just advise people to listen to 162.400 MHz, where they can hear emergency weather notifications directly from the Weather Service.

3) You can also get a ham license, if you don't already have one, and join a group called Skywarn. This will allow you to notify other hams (and scanner listeners) of severe weather that you are personally experiencing. Maybe this will satisfy your weather and radio interests.

Visit -->> http://groups.yahoo.com/group/SW_SKYWARN

Good luck!

10898. Re: [GMRS] GMRS Informational Broadcasts Use

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-28 01:18:15 UTC
From: kvsp1160@aol.com
Topic: 10889 Message: 10898

I know he's fine, just from my understanding of the FCC rules over the years.

As long as the announcements are not automatic or are pre-recordings from another source or machine. They need to come directly from your mouth. Now since this is on the FRS/GMRS shared frequency, there's that question of it being a one-way communication, but it's not considered a Base system, nor is it on a repeater system.

The second thing to put into consideration, is to possibly buy an external amp that has 35-40 watts of power, and maybe an external base antenna with a few dB gain. Your TPO would still be under 50 watts per FCC rules, but the ERP would be slightly over 60 watts, and will get out over the area better.

And again this still does not constitute as a base system.

Thus, I think it could work. Howeve, I'd atleast try to announce your weather bullitins as a two-way communication to be safe, by having two people talk about the subject, rather than one. Some folks get strict about that.

From: kvsp1160@aol.com
Topic: 10899 Message: 10899

Reguarding the National Calling Frequency:

FRS Channel One is NOT the National Emergency Channel. It is suggested to use that by several and many users and groups, but is not stated by the FCC.

As with 462.675 for GMRS, it is a suggested frequency, but is not an official emergency channel.

I disagree and agree with Kurt...

As I mentioned with my last email, there are ways of doing this. However, like I mentioned before, the rules say not to use automated announcements, but you could use voice for emergency related announcements.

In the Bay Area of Northern California, NOAA has issued a weather warning that has been in affect since Sunday evening. They announce severe advisories for coastal waters as well as for rivers and other areas. This is NOT the normal announcement that you hear on NOAA.

David could do the same. Not 24/7, but he could monitor NOAA for those severe weather advisories, send out emails or a phone tree to a group that he previously set up, and ask them to listen in on the frequency he uses. He'll then begin transmission of this Severe Weather Advisory until it is over, and then resume monitoring. This keeps the channel clearfor others to use, and also follows FCC rules stating emergency uses.

FRS bubblepacks are cheap and anyone could pick one up. NOAA radios and scanners are expensive, and not many people can buy one. It's a great way to serve the community. Especially in Florida, and for us here in CA. Both who get high surf and water damage during the winter months.

Topic: 10900 Message: 10902

Why? Why does anyone think it is important to rebroadcast NOAA warnings when there are NOAA radios and NOAA warnings are rebroadcast over one-way radios now? If people want to be warned, then they can buy either a NOAA radio or a $5 AM radio. Otherwise leave them be.

Where I live, we spend at least 12 hours a day, at least 180 days a year, under some sort of NOAA warning. People buy those weather radios and find this out. I bought one for my Dad and he turned it off after 30 days or so because there were so many warnings, even when the radio was limited just to his county. It is sort of like a "terrorist" warning --constant.

We don't need to spend any more bandwidth repeating what is already being repeated.

10909. GMRS RF Power Output

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-28 03:39:05 UTC
From: Lake Hodges Radio
Topic: 10889 Message: 10909

Yes... there's also some mumbo jumbo in part 95 about small base stations and large base stations. But that is old language from years ago and might not apply any more.

Even the FCC doesn't understand the GMRS rules, so don't feel bad if you don't either.

Hi Cris and Kurt,

I'm reading Part 95.29, and it states what Cris said. It was last updated October of 1999.

However, I read somewhere on this group that there were new GMRS rules on the FCC site that came out a year ago. I could be wrong though. So I rely on the old ones til I'm corrected. Like Cris did.

I also study GMRS only and not the FRS, so that also explains why I'm always rusty when it comes to FRS rules.

For those who are using FRS units on land and sea, small aircraft, and maybe have vacation homes on private islands. Visitors who are new to the area, the elderly who are lonely that maybe need a fresh voice in the air and not a computer talking at them, an inspiration to another youth who wants to start up a radio group.

Not just for those folks in malls and with kids who scream into them for the heck... And wonder who needs weather guys in the first place when they're wrong half of the time.

All because of one man who strived to make a difference in his community, and to help better serve his city at a low cost and service to those who already have the tools needed to hear.

My two cents.

There's an easy way around this little problem, take the word "broadcast" out of the occasion. I
have often gone on FRS 1 and just "announce" that there is a serve weather watch/warning in effect. You can't rebroadcast the actually NOAA alert without the proper id. Show me in Part 97
this is illegal. As long as I ID properly,everything is fine! I don' t have to on the MURS band,
but that's another story. I have gone on FRS 1 AND MURS (151.8800) and said there's serve weather
in the area take cover!! Nothing wrong with that!!

Those are the rules. State them, and prove me wrong.

Where in my statement, that you quoted, state that the rules are wrong?

I'm not understanding what you're saying...

You wrote:
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
The second thing to put into consideration, is to possibly buy an external amp that has 35-40 watts of power, and maybe an external base antenna with a few
dB gain. Your TPO would still be under 50 watts per FCC rules, but the ERP would be slightly over 60 watts, and will get out over the area better.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
95.27(f) -3, states that no more than 5 watts ERP may be used (by any station) on channels 1 through 7, David was talking about 462.5625 (channel 1).

95.27(f) - 2, states that you may not transmit one-way pages.

Definition of broadcast one-way communication and not allowing any other station to transmit!
ANNOUCING SEVERE WEATHER FALLS UNDER AN EMERGENCY THEREFOR PERFECTLY LEGIT! Take the word "broadcast" out of there, he's not "broadcasting". He's announcing severe weather and getting off
the air. Are you guys saying I can't go on FRS1 and say there's serve weather coming?

10918. Weather Announcements on GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-28 01:57:14 UTC
From: David W Proshek
Topic: 10918 Message: 10918

Thank you all for the responses on my question. Unfortunitely, I am just as confused (or more so). I am going to try to clear up a few points. I live in a small sub-division of about 300 homes. It is in a rural area. The population is predominately senior citizens. We are presently setting up a Neighborhood Radio Network for a crime watch in the area. We use the FRS/GMRS radios (which is legal and suggested by the FCC). We use FRS Channel 1 as our primary frequency. I receive my severe weather bulletins via NOAA Weather radio S.A.M.E. and via emails from the NWS. I would just like to voice announce these advisories, watches, and warnings, as I receive them, over our primary operating frequency. Since I act as our base network control for the watch, it seems a valid idea, to disseminate this information to the neighborhood community residents. I am only using 2 watts of power with an outside antenna. I only reach the immediate community. I am licensed to operate on that frequency with that power.

Thanks again for all your replies

Very Good on the community Watch.

Unless its a Hurricane(Emergency) NO he cannot make
Those announcements.. It is Considered a 1 way
converastion. as someone posted If he calls another
station and they reply ,and people Overhear him thats
legal..
for what he is planning on doing He should get
intouch and make Friends with the Local Chief Of
Communications at his local Police Department.
and see if he can work out a deal to get the Township
to apply for a TIS(traffic information station)
and let his group Run it by providing Community
Bulletins... when not posting bulletins it can Air
the local NOAA weather station.. Perfectly Legal..
The TIS ststion is the best way to Go...
You cannot do what you are planning On FRS/GMRS

You dont have to take my word for it. My credinetials
Im a Ham 26 years
Broadcast Engineer maintain 6 stations Own 2
& work for a Broadcast Engineering consulting firm
Neal-CE

10920. GMRS Informational Broadcasts

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-28 16:56:57 UTC
From: Lake Hodges Radio
Topic: 10889 Message: 10920

The FCC continuously says "no broadcasts to the public."

Why not just make it simple? Call one specific person and relate the information to him or her.

"This is WXYZ123 calling WXYZ789. Hi, Bill, this is Dave. Have you heard this latest weather bulletin?" Then read the bulletin. Give your call sign every teh minutes. Say "WXYZ123 clear" when you're done.

Then it's a two-way radio communication and no one can complain.

Anyone can listen in on your conversation, and they can even jump in and participate if they want.

Is it necessary to even call a _specific_ person? Instead just ask if
any person in the Weather Alert Group is available and if someone
answers then relate the info to that person.

I am aware that the FCC basically, says the all bets are off in the case of an emergency. But recently, a local ham was out hiking with a friend who fell off a rock in a remote area and broke his leg. The "ham" happened to have a modified amateur HT and called the police (or fire department) on his HT. They came out to rescue his friend and arrested him for transmitting on the public service band. You may also want to look at the enforcement action letters from the FCC against GMRS licensees on the ARRL website.

well, calling the police or fire on a modified HT, far as I know the rules is *never* OK with out authorization that you're not likely to get.

10924. RE: [GMRS] GMRS Informational Broadcasts

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-28 17:02:00 UTC
From: Adam Karsin
Topic: 10889 Message: 10924

Also if you have a fairly active repeater, or local group of users it is simple to bring up another station. I'm interested to see how this works out, keep me posted.

Subject: [GMRS] GMRS Informational Broadcasts

The FCC continuously says "no broadcasts to the public."

Why not just make it simple? Call one specific person and relate the information to him or her.

"This is WXYZ123 calling WXYZ789. Hi, Bill, this is Dave. Have you heard this latest weather bulletin?" Then read the bulletin. Give your call sign every teh minutes. Say "WXYZ123 clear" when you're done.

Then it's a two-way radio communication and no one can complain.

Anyone can listen in on your conversation, and they can even jump in and participate if they want.

From: KC2GIK
Topic: 10889 Message: 10925

Wait a minute these are TWO TOTALLY DIFFERENT ISSUES PLEASE DON'T CONFUSE THEM. The original
question was if someone could "announce" there's severe weather coming! I said YES and the subject changed into emergency calling procedures. What's the problem here?

They did NOT arrest him, however they did call him in for
a meeting afterwards, at which time in order to preclude
prosecution he turned over his radio to the FCC.
